Intermittent Venous Occlusion

SIR,—I am much interested in Brown and Arnott's account of treatment by intermittent venous occlusion (*Journal* May 29, p 1106), in which the earliest date they mention is 1925. As I was treated by this method in Germany in 1917 when a prisoner of war, and during my subsequent medical course, 1919–23, I never heard any mention of this method, can any of your readers tell me if it was used in the military hospitals on our side of the line?

I was wounded and taken prisoner near Cambrai on November 30 1917, and in three or four days arrived at Le Cateau. On December 17 my ankle was x-rayed and on the 18th I was removed to a ward in another empty factory. It was the best ward in the town there were sixty beds, four day nurses, and two night nurses under the care of Professor "Blue Nose" (I know no other name) who operated on my ankle forthwith and removed a metal fragment. The theatre was primitive and the anaesthetist unqualified.

Five or six hours later a nurse fitted an intermittent venous occlusion ring on my leg above the knee. She told me it would remain on for seventy-two hours. All the fifteen beds in my row were similarly fitted. A gaspipe ran along the wall at the head of the beds, and a T-piece with a tap came off at each one. The apparatus working this was in the middle of the row and so far as I can remember it consisted of a couple of oxygen cylinders and a larger cylinder, measuring four or five feet by two feet in diameter with a pressure gauge and a clock. I thought it worked by the boiling of liquid oxygen. From each T-piece came a thick rubber tube attached to a thin rubber ring 1½ in. wide enclosed in a stout canvas case. The period was sixty seconds with fifteen seconds complete relaxation and fifteen seconds maximum pressure.

All wounds were septic in every ward I was in owing doubtless, to the lack of staff and materials. This apparatus was applied to all the patients who were with me, all picked cases—I was there because I was an officer and the only prisoner who spoke German—and I understood it was to help the patient to overcome sepsis. I spoke of this apparatus during my subsequent hospital training to various members of the staff, but no one seemed to have heard of it—I am, etc.,

Orthopaedic Conditions

SIR—I feel that a reply to your unfavourable review of my book on *Elements of Orthopaedic Surgery* is justifiable. It seems that your reviewer has read it from the point of view of the specialist for whom the book was not, of course, intended and has little appreciation of the real needs of the auxiliary worker.

for whom the book was written. Thus he maintains that diagnosis should have been given a pre-eminent position. The truth about the diagnosis of orthopaedic conditions is that in the majority deformity or disability is obvious even to the layman, while in the minority the diagnosis of the cause of pain or other symptoms is so difficult as to need special knowledge and often special means of investigation. There is accordingly no value in an elementary book giving more than the salient points of diagnosis. Most important is the need to emphasize the risks of delay in determining the diagnosis and in beginning treatment, and this I was careful to do.

The examples your reviewer gives are unfortunate. As one who did the first work on the intervertebral disks in this country I might have been excused if I had taken more than one sentence to discuss adolescent kyphosis, but I refrained from doing so because of its relative unimportance practically. If your reviewer knows of any effective treatment for it at an early or late stage, I and other orthopaedic surgeons would be glad to know it also. Again, he complains that the reader is not told how to distinguish tuberculous disease from non-specific arthritis of childhood. He must be well aware that this is a specialized matter, and even with special knowledge and laboratory investigations may be very difficult. What need is there to discuss such differential diagnosis in an elementary textbook or to go into fine points of x-ray appearances, as your reviewer would have had me do?

I agree with the reviewer in the importance of the part played by the general practitioner and nurses in the early recognition and the successful treatment of an orthopaedic case. Every orthopaedic surgeon realizes this, and that the success of his work is largely dependent on the well-organized and understanding co-operation of these and others who assist him or see to the welfare of the patient. It was precisely for this reason and because there was no recent suitable book to which they could turn for information that this book was written. It may have failed, perhaps, to give all the information these persons need, but I deny that it is lacking in the ways your review indicates—I am, etc.,

Bournemouth May 31

N ROSS SMITH

Air Raid Precautions

SIR—I find myself very much in sympathy with the opinions expressed by Dr Leys and Dr Macdonald Ladell (May 22, p 1091, and June 5, p 1179) on this subject. Has not the time come for a more collective expression of opinion by the medical profession, or at least for more serious consideration and discussion of the duties in connexion with air raid protection for which doctors throughout the country are now being called upon to prepare themselves and others? The instruction which is being given is mainly in connexion with gas while the real danger it is well known would be from high explosive and incendiary bombs or a combination of all three methods. Adequate protection against all of these in a crowded city is generally regarded as impossible and attack with high explosive and incendiary bombs would in fact largely neutralize the efficacy of all the methods of protection against gas except perhaps the wearing of a mask. Under military discipline it is possible to train men in the use of gas masks but the training of the whole civil population is out of the question and in any case it would be a poor comfort to parents to learn the use of masks when these cannot be provided for or worn by small children.

The present anti gas drills are deluding the public into a belief that useful steps are being taken for their protection and at the same time, as Dr Macdonald Ladell points out are fostering the war mentality and the idea that war in the near future is probable or inevitable. Is it proper for doctors to subscribe to a prophylactic measure which is so inadequate and deceptive, or to support educational procedures of which the psychological consequences are so undesirable?

Although I hold my own views, the columns of the *British Medical Journal* are not, perhaps, the place to discuss whether an intensification of pacifist endeavour or rearmament in order to "do likewise" to the enemy in the event of an attack is the better form of prophylaxis. These are matters for all of us to consider constantly. If, however, war comes there will remain one indisputable duty for doctors, and that will be the task of supplying as efficient an ambulance and hospital service as possible for the stricken multitudes. No provision for such services seems to be contemplated at present either by the Government or by our profession. The organization of such services would surely be more consistent with the true function of our profession than playing at gas attacks and delivering lectures to lay audiences with an assumption of authority which neither experience nor conscience can justify—I am, etc.,

Cambridge, June 7

JOHN A RYLE

*: The task of supplying efficient hospital services is being carefully considered by the Committee for Imperial Defence in co-operation with the British Medical Association—Ed. *BMJ*

SIR—I think the letter under the above heading by Dr Duncan Leys (*Journal* May 22, p 1091), admirable, and I heartily agree that the present precautions are hopelessly inadequate. We, as a profession, are being asked to participate in defence measures, but as far as I know no opportunity has been given to us to express any opinion on the efficacy, or otherwise, of those schemes in which we are to play such an important part. Little opportunity is given during official lectures for discussion and constructive criticism. Scientific and controlled experiments conducted at Cambridge cast grave doubts on the whole Government scheme. These have been passed over by the Government with the insinuation that they are the work of Communists. The medical profession is moving rapidly towards the preventive aspects of medicine, and I suggest that in this respect it has a right and a duty to see that if war does come the population has knowledge of what to expect and also knowledge that everything possible has been done to minimize the senseless destruction of human life. To date an impartial observer must agree that our weapons of offence have received far more attention than those of defence—I am, etc.

London W.5 June 1

H JOULFS

SIR—Dr Ladell (June 5 p 1179) states that he refuses to take part in air raid precautions. I take it he would not withhold any active treatment of any gas cases. If so he says in effect "I will do all I can to treat gas cases but I refuse to give any precautionary advice as to respirator drill—a somewhat illogical statement—I am, etc.

W A BELLAMY Lieutenant R.A.M.C.(T)
London S.E.26 June 5

Prevention of Constipation

SIR—May I emphasize the importance of the psychological factor in the treatment of constipation by referring to the way I have attempted to deal with the problem at a certain L.C.C. mental hospital.

A distressingly large proportion of the public have been hypnotized by a barrage of advertisements, and now firmly believe that (1) they are constipated, (2) this does them harm, (3) it requires regular treatment by salts, pills, chocolate laxatives, or patent what nots to restore their normal bowel function. Patients in mental hospitals are in this respect like the rest of the public. They often state that they are constipated—usually without adequate proof. They insist on being given a regular dose of white mixture at least once a week and often more frequently. If this request is granted by the nurse in charge (ordinary aperients in mental hospitals being given at the discretion of the nurse and signed for by the doctor *after* the event) a habit is formed and the patient regards his regular dose as a necessity. If deprived of it he may develop hypochondriacal ideas and believe his bowels are becoming blocked.

I have in my own hospital work found a satisfactory compromise. All the patients who ask for their regular 'dose of white' are given it as usual, but the prescription, originally mag sulph 60 grains or more, with mag carb levis, 10 grains, and peppermint water, has been secretly and gradually reduced until there is now no magnesium sulphate in the mixture at all. The magnesium carbonate is retained so that the mixture looks exactly the same. No patient has yet remarked on the reduced efficiency of the present medicine, nor has any nurse. As neither know of the change, it would seem that the present mixture works chiefly by suggestion.

The routine administration of aperients is, in my opinion, strongly to be deprecated. If the constipation is of significance it should be investigated, the cause found, and if possible treated. May not organic alimentary trouble be overlooked in its earlier stages if the patient is given aperients at the discretion of the nurse? Alternatively, if the constipation is without significance or illusory, are we considering the best interests of the patient if we tacitly allow him to be dosed with aperients until he develops a habit and possibly a real constipation as a result? I suggest that the time has come to combat the mass suggestion of the aperient advertisers and manufacturers. It has been said that constipation is practically unknown among savage tribes—or among the inhabitants of this country in the Middle Ages. Is the reason entirely one of diet or mode of life? May it not be that these people had not yet heard of constipation? When they were ill they took a purge but when they were well did they think of taking anything to preserve their inner cleanliness?

The public has been given an irrational fear of constipation by the aperient monger. It is our duty to allay that fear even if it results in reducing the profits of the firms involved. So as not to break the spell which is at present working the bowels of the 500 male patients in my wards may I sign myself—*anonymously*—

J. M. T.

MAG SULPH

Maternity Services

SIR—Dr Elam's letter in the *Journal* of May 29 (p. 1170) is interesting but does not take us much further towards solving the problems before us. The desirability of one practitioner being "responsible for each patient before and after her confinement" is recognized

by everyone. Where "failed forceps" is due to their too early application all would agree that to have soothed the patient, either as Dr Elam suggests or with nembatal or hyoscine, would have been sound treatment.

Obstetric operations in unsuitable homes are certainly undesirable, but before we rush in with sweeping plans for the conduct of our brother practitioners' practices, should we not inquire how often each of these factors occurs by itself and how often are both present in any case? Are not about 95 per cent of confinements obstetrically normal? And if ante-natal work is efficient, will it not result in the abnormal case being detected and if necessary referred to hospital? Then again, are unsuitable homes so very common? The nurses from two London hospitals, attending poor patients in their own homes, can show a maternal mortality rate of only 1 per 1,000.

A maternity scheme is bound to be evolved in each area, as Dr Elam suggests, and until we see how much help this is going to provide for the general practitioner who is interested in this work it would be best, I submit, not to come to any hasty conclusions regarding the future of domiciliary midwifery—I am, etc.,

London, W 10, May 31

HUGH SUTHERLAND

Medico-Legal

HERMAPHRODITISM

Some Medico-legal Conundrums

Hermaphrodites have always excited interest, but recent developments in sexual endocrinology have given these rare and curious persons much greater importance. Mr Harold Chapple, in his article in the *Journal* of April 17, considers that the value of the ovarian secretions is more superficial than is usually supposed in determining the type of an individual. Other authorities have, however, expressed strong disagreement with him in the correspondence columns of the *Journal*, and minute investigations on a series of hermaphrodites might do great service in defining more precisely the role of the gonads in producing a sexual type. A case not unlike Mr Chapple's was described several years ago in which a supposed female person appeared to have neither uterus nor ovaries but two buried testicles.

Dr L. Ombrédanne¹ describes a "gynander" who set him a few legal conundrums. (As by French law this patient is a male it will be convenient to use the male pronoun.) At 22 years he has a hairless body except for the pubic region, breasts like a girl, a more or less female pelvis but large hands and feet. He has a small penile organ in a condition which would pass for a male hypospadias but which was not remedied by an earlier operation. On the right there was before intervention, an ample pocket containing a palpable gland the shape of an almond and surrounded by an organ which felt like an epididymis with a large head. On the left there is an empty scrotal fold. The lower aspect of the penis and the perineum are covered with scrotal skin and this conceals in front of the anus, a small orifice lined with mucosa and large enough to admit a sound. This is the outlet of the urinary canal and of a menstrual flow. The patient has behaved sexually like a man, and since the age of 16 has had connexion with several women: he experiences erection but no ejaculation and does not obtain complete satisfaction. His voice however is feminine and since 13 years he has menstruated regularly every twenty-eight days for six days at a time. At birth the doctor had no doubt that he was a male and he was registered as

¹ *Presse Méd.*, March 3 1937, p. 229.

one, at 14 the gland which has been described descended into the right scrotal cavity. At 20 he was declared unfit for military service, and at 21, when a surgeon suggested removing his breasts, he came to Professor Lecomte for advice. An exploratory laparotomy revealed a slightly small uterus and a large polycystic left ovary complete with salpinx. On the right the adnexae disappeared into the inguinal canal, the salpinx and the upper margin of the broad ligament were pulled out into a string and were housed in a right inguinal hernia. The next problem was to establish the patient's legal sex. This is important in France to a degree unintelligible in this country. To change the sexual status of a French person it is necessary for the parents, if the person is a minor, or the person himself if he is of age, to move the court to examine into the circumstances, judgement is given on the evidence. In the present case the patient is legally a male and wishes to remain one. Although he has a uterus, ovaries, and periods, he has no patent vagina, and Dr Ombrédanne considers there is little reason why he should not remain a male. On the other hand, he was intending to marry a girl with whom he had been living for two years, and she could undoubtedly in France have obtained a decree of nullity on the ground of the husband's real or "abdominal" sex—if she could get over the obstacle of the French legal prohibition which forbids the surgeon who attended the husband to reveal any facts concerning his patient. The author decided on balance that it would be better to facilitate the patient's life as a male, according to his wish. In this country the only objection to this course would probably be that the patient might marry, and as he is sufficiently competent sexually to penetrate the vagina his wife would find it very difficult to obtain a decree of nullity if she wanted one.

A somewhat similar case is reported from Nancy by Drs A. Binet and Demange,¹ but that person had more obviously male external organs and a well-developed pair of female breasts, also a rudimentary vagina in which he was in the habit of concealing stolen jewellery. He was a Jew of 37 and had been circumcised. The authors did not investigate his internal organs and so the story is very incomplete.

Surgical Intervention

Our comparative lack of interest in hermaphroditism or gynandry, in this country may be due to its comparative insignificance in English law. In countries which need to maintain large conscript armies every male person is a national asset of great importance, to be carefully watched over from birth. In France, for instance, the sex is registered at birth as in this country, but the entry in the register seems to have a much more conclusive legal effect and if there is any doubt about the sex the register can only be amended by the order of a special tribunal. The register seems to decide questions of inheritance and others in which sex is important. There is also a specific legal prohibition against castrating a male person, and Dr Ombrédanne refers to this as though a French surgeon ran a serious risk if in a case of doubtful sexuality he decided to remove a pair of buried testicles and let the patient live as a female. In this country the somewhat theoretical legal prohibition of castration which is always quoted in discussions on sterilization would never be invoked against a surgeon who removed testicles on good medical grounds. Mr Chapple ran no risk at all in removing the testicle—assuming that it was a testicle which does not seem to be universally admitted—from his attractive patient. Similarly we hardly ever hear of hermaphrodites in questions of inheritance probably because sex only matters in connexion with entailed property which is a family affair. The rules for the division of the estate of a man who does not leave a will make no distinction of sex.

Criminological Aspects

One other branch of law in which hermaphroditism might theoretically be significant is the criminal law against indecent conduct. The law prohibits sodomy and punishes it very heavily, a lesser but still grave offence is that of gross indecency between male persons. There is no legal prohibition against lesbianism. It is impossible, however, to imagine a court convicting a man of gross indecency if his partner's sex were in any substantial doubt. Mr Chapple does not seem to have suggested, in his closing remarks about the law, that his patient would be regarded legally as a male person. The most likely circumstance in which there could be any dispute about the sex of a partner would be if the accused man pleaded in his defence that the partner was not a male and called expert medical evidence.

Obituary

CHARLES SHORNEY WEBB, M.S., F.R.C.S.

On June 1 Charles H. Shorney Webb died in the hospital where he received his medical education and where for a dozen years he had been a brilliant member of the honorary surgical staff. Webb had a fine academic career, gaining honours and distinctions not only in the Middlesex Hospital Medical School but also in the University of London, he was only the fourth "Middlesex" student to secure the M.S. degree, and obtained marks qualifying for the gold medal on that occasion.

During his tenure of a surgical registrarship at Middlesex Hospital the "wanderlust" seized him, and he served in the Balkan Campaign in 1912, in 1914 the first day of the great war saw him eager alike for adventure and to place his talents at the disposal of the British wounded. Webb landed in the original Expeditionary Force with the Fourth Casualty Clearing Station, a unit with which he remained until 1918, when he was appointed to the charge of a surgical division of the 24th General Hospital at Étaples. At a time when opinion was still divided as to the desirability of exploration for gunshot wounds of the abdomen he was one of the first to operate for this type of injury. To Owen Richards, of course, belongs the credit of demonstrating and of urging the need of surgery in these particular wounds of warfare, but the first considerable communication dealing with the subject was written by Webb and Milligan.

Elected *in absentia* to the honorary staff of his old hospital during the war years he did not assume his duties until after the armistice. With a far greater operative experience than usually belongs to a newly appointed assistant surgeon, Webb proved himself also a fine teacher, acquiring a popularity with the students akin to that which he had enjoyed among his fellow workers in his early days and in France. Furthermore, his surgical advice and services were eagerly sought by his colleagues and their families.

We read in Euripides how those whom the gods wish to destroy they first drive mad. Thus it seemed with Webb his camaraderie and his genius for friendship became a vengeful Alastor, diligence languished, and he slipped suddenly from our midst. Nevertheless when all seemed lost when all was plunged in "lead-eyed despair" pluck still burned within him, and surprisingly unexpectedly a veritable Samson Agonistes he staged a great come back. The London County Council sponsored this return—he lived long enough to justify the con-

¹ *Rev. med. Nancy*, March 15, 1937, p. 267.

fidence again reposed in him, and became a valued operating surgeon to the Middlesex County Council. Time was indeed granted him to earn again the admiration of his erstwhile colleagues, but the events of his life might well be the theme of an Aeschylean tragedy 'the mighty Fury from her dark depth of counsel requites to the uttermost', his days were cut short by an infective endocarditis, which killed with inexorable certainty.

Webb's gifts were many. He was a fine linguist, a lover of music, he played piano and organ, he loved churches and old ecclesiastical architecture, and the memory may still linger in the minds of his war comrades of the strains of some church organ, by strange caprice intact, pealing forth from a ruined church without roof, with walls wide open to the air, an anthem perchance strange to the rude ears of that time, and within a debonair surgeon playing intently and with an exquisite skill. His surgery demands this tribute from an old chief and former colleague, as does also the courage of the man. And yet how difficult it is to stifle the thought of what might have been.

G G-T

CHARLES IRVINE MILNE, MD

Physician North Staffordshire Royal Infirmary Stoke-on Trent

The death of Dr Charles I Milne on May 29 at the age of 53 has come as a profound shock to the entire population of Stoke-on-Trent, where he was esteemed and beloved alike by patients and colleagues. Son of the late Dr Irvine Milne of Shipdham, Norfolk, he was educated at George Watson's College Edinburgh and Edinburgh University, where he graduated M.B., B.Ch. in 1907, and later obtained the M.D. degree, after serving as clinical assistant in the University medical wards.

Dr Milne came to the "Potteries" as a young man, and served as house physician and later as house surgeon at the North Staffordshire Royal Infirmary. He relinquished these appointments to take up practice in this district where he worked with untiring energy, giving himself wholeheartedly to the service of his patients. During the war he served with distinction in India attaining the rank of captain R.A.M.C. He afterwards returned to his practice and was appointed honorary assistant physician at the Infirmary in 1927 and became honorary physician in 1932. At the time of his death Dr Milne was chairman of the Medical Board. A regular attendant in the wards and an ever present member of many committees he lived to be highly respected and honoured by all who had the pleasure to work with him. For the past twelve years he acted as honorary secretary to the North Staffs Medical Society and this society owes a deep debt of gratitude for his courtesy, tact and capacity for hard work at all times. He joined the British Medical Association in 1911 and was deputy representative for the Annual Meeting of 1920.

Of a rather retiring disposition and unassuming character it took some time before one knew Charlie Milne really well, but then it was evident that there was a genuine note to the core whose whole aim and object in life was to play his part manfully and well and give of his best to those depending upon him. He had not in even in his old age and has been very truthfully said of him that nobody ever heard him use an unkind word of any sort. His sympathy was extended to his wife and his two young sons.

R A. K.

A familiar figure at international medical meetings, Professor EDVARD LAURITZ EHLERS will be missed by a wide circle of friends. His death occurred on May 6 in his seventy-fifth year. He was born in 1863 and began his studies in Copenhagen in 1880. He studied dermatology in Germany, Austria, and France, and in Denmark he was in charge of the Welander Homes for children suffering from congenital syphilis. His studies in leprosy took him to Iceland, the Balkans, the West Indies and many other parts of the world, and he was the organizer and secretary-general of the First International Leprosy Conference, held in Berlin in 1897. He was editor-in-chief of the *International Archives of Leprosy* and president of both the Danish and the International Union against Venereal Disease. The honours bestowed on him abroad by medical societies, universities and Governments were many, and included membership of the French Academy of Medicine. One of his most valuable contributions to medicine was his ambulant treatment of scabies. At international meetings Professor Ehlers was thoroughly at his ease thanks to his linguistic gifts and happy knack of mixing easily with all sorts and conditions of men. He had a genius for making the complete strangers he met at medical congresses instinctively feel that they were at least his equals—a remarkable gift in a man with few equals in his own sphere.

We regret to announce the death on June 4 of Dr WILLIAM FRYER HARVEY at the age of 52. From Bootham School, York, he went to Balliol College, Oxford, taking the M.A. in 1910, and the M.B., B.Ch. in 1917 after further medical study at Leeds. He had joined the Quaker training camp at Jordans in August, 1914, and went with the first detachment of the Friends Ambulance Unit to Flanders. On graduating in medicine he took a commission as temporary surgeon lieutenant R.N., and two days before the armistice was awarded the Albert medal for saving life at sea. This act of bravery was the risking of his life to operate on an engineer trapped in the wrecked and flooding engine room of a destroyer. Dr Harvey was dragged out unconscious from the effect of oil fumes and never fully recovered from the strain. He acted for a time as Warden of the Fircroft Working Men's College at Selly Oak, Birmingham, but had to abandon this owing to a breakdown of health. For some years he lived at Weybridge and devoted himself to literary work, in 1935 he moved to Leichworth.

The death of Dr A. CHARLES E. GRAY was reported in the *Journal* of May 22. L. A. H. writes: 'To-day there is a tendency to belittle the work of all voluntary social agencies, and to prophesy their ultimate replacement by State control, but it must not be forgotten that at the end of last century there was a band of voluntary social workers keenly interested in promoting schemes for the improvement of public health conditions. One of these was the late Dr Charles Gray. In 1894 Dr Gray became a member of the Medical Advisory Sub-committee of the Charity Organization Society, a connexion which lasted for over thirty years during most of which time he acted as chairman. With the late Sir Charles Lock and the late Colonel Montefiore he was responsible for placing the training of hospital almoners on a scientific basis and when at the end of 1907 the Training Council which later became the Institute of Hospital Almoners was formed Dr Gray was chairman from that date until his retirement in 1931. Before the Maternity and Child Welfare Act of 1918 came into force most if not all child welfare centres were in the hands of voluntary workers. Dr Gray was honorary medical officer to the Stepney Centre from its inception until the control was handed over to the medical officer of health in Stepney. When the first voluntary tuberculosis dispensaries in London were instituted by Herbert Woolf, came Lady Jones and Miss McGaw. Dr Gray was a prominent member of the Stepney Dispensary which, after being set up, was afterwards purchased by Lady Jones and the local authorities.'

Dr JOHN ROUND who died after a long illness on May 18, was born at Dudley, Worcestershire in 1862, and studied medicine at the Birmingham Medical School becoming L.R.C.P. & S.Ed and L.R.F.P.S.Glas in 1889. He later obtained the D.Sc of the Inter-Collegiate University, Chicago. After serving as assistant physician to the Plymouth Public Dispensary Dr Round settled in general practice in South London, and was for some years honorary physician to the Battersea General Hospital. He joined the British Medical Association in 1890, and had been chairman of the Greenwich and Deptford Division. Dr Round was a man of wide interests, and contributed from time to time to medical journals. His death in hospital following an operation, took place seven months after his retirement from active practice.

Medical Notes in Parliament

On June 8 in the House of Lords the Widows', Orphans', and Old Age Contributory Pensions (Voluntary Contributors) Bill passed through committee. The second reading of the Marriage Bill in the House of Lords is set down for June 17. Lord Kinnaird is in charge of the measure. The committee stage of the Methylated Spirits (Scotland) Bill in this House is also down for June 17. Lord Kinnaird sponsors this Bill.

The House of Commons this week discussed the estimates for the Ministry of Health and for the Ministry of Agriculture and Fisheries and began the committee stage of the Finance Bill. Introducing the Health Estimates Sir Kingsley Wood spoke of the progress in influenza research and the incidence of other diseases. He drew attention to the fall in the birth rate, and announced that inquiries were in progress into the trend of population. Further information would be secured about fertility. He discussed housing, nutrition, and maternity and child welfare services.

A new initiative for regulation of the trade in proprietary medicines may soon begin. There was a preliminary discussion at the House of Commons this week. The Drainage of Trade Premises Bill passed through a Standing Committee of the House of Commons with amendments on June 8. The committee stage of the Trade Marks Amendment Bill is set down for Standing Committee on June 15. Three days next week in the House of Commons will probably be allotted to the report stage of the Factories Bill.

Health in the Colonies

The Vote for the Colonial Office was debated in the House of Commons on June 2. Mr. ORMESBY GORE said he wished immediately to explain his position on the *mutisai* question. He awaited the considered comments of the Governors of Hong Kong and of the Straits Settlements and of their Executive Councils on both the majority and the minority reports on this question. Both in China and in the settled Chinese population of British Malaya and Hong Kong there was a growing public opinion of a more Western character which viewed these old social customs of China as things which ought to be done away with or to be changed.

Mr. WILLIAM LUSK moved the reduction of the vote and discussed the possibility of abolishing the *mutisai* system. He also spoke on problems in the African colonies. He drew attention to a report by a committee instituted by the Governor of Nyasaland to inquire into migrant labour. This report said that 120,000 adult natives, a quarter of the adult male population of Nyasaland were living away from their homes and not more than 5 per cent. had their women with them. In the West Indies problems of education and health called for attention. In Barbados malaria and typhoid were common. Food was poor and lacking in nutritive value. Sanitation was bad. People lived in overcrowded conditions. Wages were low and unemployment was high.

Mr. JAMES H. KENNEDY spoke of the social problems

be profitably employed in the lower levels of the mine. The Labour Opposition opposed the drawing upon the colonies for this kind of labour. Conditions in the Rand were unnatural and there was a tremendous amount of vice in the compound. Already Nyasaland was being denuded, and in some districts at least 80 per cent. of the men who left the villages did not return again.

Mr. ORMESBY GORE said it was desirable that the Government should take greater control than in the past of the migration of the Nyasaland boys. The Nyasaland native was particularly independent but if he went to the big mining areas he had to be looked after. He hoped to ratify the International Labour Convention on the recruitment of native labour. Experience of the migration of Nyasaland boys was so far satisfactory on the health side, and Mr. Creech Jones was out of date when he talked of the vicious life in the compounds. The improvement in the compound system of the mines in recent times had been remarkable.

NATIVE HEALTH IN KENYA

Sir ERNEST GRAHAM LITTLE quoted a West African chief who had said that the natives of West Africa owed their retention of the land to the mosquito which had checked the flow of white emigration into West Africa. In Kenya, on the other hand the native reserves represented a small proportion of the total acreage and the density of population in those reserves was calculated at 250 to the square mile which exceeded the density of population in British India and was accompanied by desperate poverty that was largely responsible for the health conditions. The Director of Medical Services in Kenya had told him it was impossible in most instances to collect a hut tax of 12s. 6d. per year, the whole income of a native family in Kenya being estimated by him at about £3 a year. In Nyasaland the position was even worse and the resulting migration of 50 per cent. of the adult males broke up the tribal system and spread infection.

An important research was conducted in Kenya in 1926. The conditions of two neighbouring tribes in the native reserves was compared and one tribe was found to be inferior to the other in height, weight, muscular strength and in resistance to disease. The dietary of the inferior tribe was found to have weakened their resistance to disease. The members lived chiefly on agricultural products while the diet of the other tribe was principally fresh meat and fresh food of every kind. A second investigation was made of the incidence of disease in certain parts of Kenya. A sample of some 650 individuals was taken a quarter of whom were children. Anaemia was found in 570 out of the 650 (haemic) murmurs in 546 malnutrition in 425 rashes in 446 pyorrhoea in 406 malaria in some 300 tuberculosis in 159 and venereal disease in only 5. These figures disproved the assertion that venereal disease was the cause of so much ill health in Africa. Of 436 individuals in that sample specially examined for worm infection 344 showed infection from hookworm. Each of the individuals examined could be described as an ambulant pathological museum. It was a grave indictment that Parliament allowed such a degree of preventable disease in any part of the world for which it was responsible.

Infantile mortality in many parts of Kenya was estimated at 40 to 50 per cent. this was partly the result of the general incidence of disease. Some 95 per cent. of a large sample of children under 10 were found to be suffering from malaria and there was a 75 per cent. incidence of hookworm. Yaws

and the relation of the capacity of the skull to the brain underneath went out to Kenya and conducted an investigation on his own account. The results of the investigation were published in the medical press and in many of the newspapers in November, 1933. In January 1934 the medical profession in East Africa represented by the combined Branches of the British Medical Association in East Africa, discussed the investigations and urged the Government of Kenya and the Home Government to prosecute a research investigation was also urged in influential medical quarters and the Press, but nothing was done, although the Colonial Secretary admitted the desirability of the research.

In May, 1936 the medical profession again urged prosecution of the same research. A startling thing happened. One of the doctors engaged in the research received an offer of promotion to leave Kenya. The consternation of the medical profession in Kenya was shown by the dispatch of a petition to the Governor protesting against the proposal to move this doctor. There were two reasons for this: the immediate cessation of the research, and the effect on the great laboratory in Nairobi. The Pim Report pointed out that this was the centre of research for the whole of Africa, and at a cost for the whole laboratory of under £16,000 a year it provided pathological data which would cost at the ordinary price over £20,000 a year. The doctor was reinstated and was given a right salary and an improved status. Since then there had been another example of administrative harshness. Dr H. L. Gordon, the senior doctor of the research team, learnt from the newspapers that he had been retired. He had been left without means after a long period of service and the work of the team was destroyed by that removal.

MEDICAL ESTABLISHMENT ON THE GOLD COAST

Mr SORESENSEN said Dr Selwyn Clark's report on the Medical Department of the Gold Coast for 1935 was disturbing regarding the deterioration of the physical well being of the natives. That report was less reassuring than in recent years, a fact connected with the decline in the available medical staff even though the number of patients had increased. In 1929 ninety medical officers attended 249,476 patients, whereas in 1935 sixty-six medical officers attended 273,000 patients. For the treatment of leprosy there was a shortage of staff. Mr Sorensen would like to hear some indication that investigation was going on into possible incidence of silicosis and tuberculosis on the Gold Coast.

Sir HENRY PAGE CROFT said the huts in Kenya of whose insanitary condition Sir E. Graham Little had spoken were all in the native reserves. The Government attempted to leave the natives in the conditions of life in which they preferred to dwell. He begged the Committee not to press too far the idea that they could compel certain tribes to eat a form of diet which specialists in this country considered to be good for them. He had himself tried experiments in this matter with native employees in East Africa and received weekly reports on the physical condition of those in his employ. It was in the interests of everyone engaged in productive work in Kenya to see that the natives were fit. Mr PALING said experience had proved that natives from the Tropics employed on the Rand were subject to a very high death rate. A considerable number had pneumonia and because of the high mortality the migration was stopped. Now recruiting had begun again. It was a dangerous experiment to renew. He hoped there was some real guarantee that the circumstances which existed previously had been altered.

Mr ORMSBY-GORE said he would deal with the questions raised by Sir E. Graham Little. He (Mr Ormsby-Gore) had not been as impressed as Sir Ernest with the scientific value of the research into brain capacity of certain natives and although some doctors agreed with Sir Ernest a great many doctors agreed with him (Mr Ormsby-Gore). Before he could authorize any expenditure for medical research, either of this or of any other character in Kenya or elsewhere he must take advice from the Medical Research Council of this country and that body did not advise this research. Dr Gordon was

never a Government medical officer. He went out to Kenya on his own after the age of 60. He was a well known alienist who had specialized in particular branches of mental illness, and the Government of Kenya was glad to employ him as a local consultant in connexion with the asylum at Nairobi. When he reached the age of 70, which was far beyond the retiring age of most people in the Tropics and had been in Kenya six or seven years the Government concluded it was essential to have a whole time medical consultant and a younger man and they therefore dispensed with the services of Dr Gordon. Mr Ormsby-Gore said he was glad that Dr Vint, a young and able consultant, had been able to carry on in Kenya. He had been offered a better post with higher pay in Mauritius, but there was a great wish that he should stay in Kenya, and he had been induced to stay there.

Sir E. Graham Little had suggested it might be possible that brain deficiency was the cause of malaria and other diseases. That could not be so. Malnutrition might be one of the causes but the causes of most of these tropical diseases were known. There was only one way to deal with malaria, and that was to kill the mosquitos. Yaws was a disease on which remarkable work was being done by the British medical staff all over Africa. The experimental migration of natives from Nyasaland to the Rand had been allowed because there had already been a successful migration of natives north of latitude 22. The results were now very different, and although there were some cases of pneumonia there were very few deaths. Until we had a full report no more natives would be allowed to go but so far the reports were satisfactory and he had no ground to believe there was any special danger to health. There would be a further opportunity of debating this vote.

The House divided, and the vote was approved by 141 to 89.

Certified Insane in Scottish Mental Institutions

On May 25 Mr ROBERT GIBSON asked the Secretary of State for Scotland how many persons were detained in mental institutions in Scotland as certified lunatics on December 31 in the years 1930 to 1936.

Mr ELLIOT in reply, circulated the following table

	1930	1931	1932	1933	1934	1935	1936
Numbers of persons detained as certified lunatics in mental institutions in Scotland on December 31 of each year	17,650	17,935	17,915	18,069	18,251	18,353	18,304
Numbers received into such institutions each year	3,061	3,009	2,800	2,987	2,732	2,760	2,533
Numbers who were received and who were married persons	1,100	1,147	1,093	1,098	988	1,039	962
Numbers who were discharged each year	1,396	1,262	1,285	1,314	1,186	1,221	1,217
Numbers who were discharged and who were married persons	588	535	558	570	529	509	504
(a) Married and had been detained							
(1) for less than 3 years	547	490	520	520	455	460	449
(2) for 3 years and less than 5 years	17	22	22	19	22	23	13
(3) for 5 years and less than 10 years	15	14	10	24	16	15	2
(4) for 10 years and less than 15 years	5	5	4	5	3	7	3
(5) for over 15 years	4	4	2	2	3	4	2
(b) Unmarried (including widowed and divorced persons) and had been detained							
(1) for less than 3 years	729	649	654	674	579	635	633
(2) for 3 years and less than 5 years	40	30	33	27	33	3	5
(3) for 5 years and less than 10 years	29	26	21	23	24	23	30
(4) for 10 years and less than 15 years	5	7	10	11	10	9	14
(5) for over 15 years	5	5	9	9	11	10	9

Tuberculosis in Wales

Sir KINGSLEY WOOD replying on May 27 to Mr James Griffiths, said that although the rate of mortality from tuber-

culosis in Wales was higher than in England and Wales as a whole there had been a substantial decline in the rate in Wales as well as in the rest of the country. This decline amounted to 38 per cent. on the figures for 1935 as compared with 1910. In Wales the arrangements for the treatment of tuberculosis were made by the Welsh National Memorial Association on behalf of the Welsh county and county borough councils. A survey of the services provided by the Association was being undertaken by one of the medical officers of the Welsh Board of Health. He awaited the results of this survey before considering what further measures were required.

On the same day (May 27) Mr JAMES GRIFFITHS asked the President of the Board of Education whether having regard to the high incidence of tuberculosis in Wales the school medical officers of health in the Principality had made any reports on the large number of school buildings that were unsuitable and should be replaced, and on the fact that in the rural areas children have to walk long distances to school, and during inclement weather had no facilities for drying their clothes. Mr OLIVER STANLEY replied that a few school medical officers had called attention to these matters in their reports but the great majority had not done so. He knew the importance of improving or replacing unsatisfactory school buildings. Progress was continual in this respect. As regards provision of facilities for drying children's clothes and for providing a midday meal, attention had been called to these matters in the Board's pamphlet on elementary school buildings and in a circular issued last year. He hoped to secure a substantial extension of these facilities.

Marriage Bill

The remainder of the report stage of the Marriage Bill was taken in the House of Commons on May 28 and the third reading followed. This Bill is a private member's measure but the Government provided the time for these stages. On the report stage Sir THOMAS O'CONNOR, Solicitor General explained an amendment previously proposed dealing with grounds of divorce. He said that under the Bill a party could not within five years of marriage ask for a divorce for adultery but the party could go to the court and ask for a judicial separation on the grounds of adultery. The amendment was drawn to make it clear that in those circumstances when the five years were up the party might ask on the same grounds for a divorce. The amendment was accepted. The House accepted an amendment moved by Mr SELLERS providing that the Act should come into operation on January 1, 1938.

Mr DR L. A. HURF moved that the Bill be read a third time. Sir ARTHUR WILSON, in seconding, said the marriage laws had been under consideration four times since 1912. Public opinion had developed rapidly since then and although the need for marriage might have weakened among certain classes it had strengthened in others. A report recently presented to the House on maternity showed that of 26,000 illegitimate births registered less than half were first births. The remainder were the offspring of men and women living lawfully together who were precluded by the law from regularising their union by marriage. Once the Bill became law he was confident there would be a steady reduction in the number of illegitimate births registered.

suffering from mild mental disorder to know that if she required care and treatment for five years she could be divorced would be likely to induce serious mental disease.

Sir WM WAYLAND said a very small percentage of lunatics and people of unsound mind recovered after five years. Mr LYONS said the word lunatic did not occur in the Bill. There was not a word in it about certification or about any technical classification. There was a great difference between an act committed by either husband or wife which was clearly a matrimonial offence and the visitation of a disease which nobody could prevent. Mr H. STRAUSS said Clause 1 of the Bill which forbids a divorce within five years of the marriage introduced a provision which did not exist in the law of any other country. It would cause suffering and the number of hasty marriages which would be prevented was infinitesimal.

Mr A. P. HERBERT replying to the debate said the definition of cruelty in the Bill was one which had been accepted by the Ecclesiastical Courts for hundreds of years and did not include anything in the nature of mental cruelty.

The Bill was then read a third time by 190 to 37, and was sent to the House of Lords.

Admission of Alien Doctors

Mr ROSTRON DUCKWORTH on May 28 asked the present policy with regard to the admission into this country of foreign doctors, dentists, research workers and students etc. the aggregate number permitted to settle here in the last two years and what representations had been received from professional bodies in this country on the subject of this form of competition.

Mr GEOFFREY LLOYD replied that the policy was to restrict closely the admission of foreign doctors and dentists who wished to set up in practice in this country after being admitted to the *Medical and Dentists Registers*. Since March 1935 the rule had been not to permit foreigners to engage in medical practice in the United Kingdom save in the most exceptional circumstances. The same rule had been applied in the case of foreign dentists since February 1936. No general figures of the numbers to whom permission to practise had been granted were available. The admission of refugee doctors and dentists from Germany had been the subject of representations from and discussion with the various professional bodies concerned and separate figures had been kept of the numbers of refugee doctors and dentists to whom permission to set up in practice had been granted. They were 183 doctors and seventy-eight dentists of whom the large majority, in the case of the doctors had either been granted permission to practise or had commenced their studies for a British degree before March, 1935 and in the case of the dentists had been admitted to the *Dentists Register* before February, 1936. As regards research workers and students whose work did not involve employment in the service of a person or firm in this country no obstacles were placed in the way of their admission provided their maintenance here was assured but they were expected to leave on the completion of their research or study. If employment was involved they were not admitted unless in possession of a permit issued by the Minister of Labour to their respective employer in accordance with Article 1 (3) (b) of the Aliens Order 1920.

invitations to serve on it Lady Amptill, Mrs. A. E. Astley, Professor J. L. Brierley, Mr. E. Ford Duncanson, Dr. Robert Hutchison, Sir William McKechnie, Mr. H. R. Tutt and Mr. Cecil Whiteley, K.C. One other woman member will be announced soon.

Eradication of Diseases Among Cattle

The following is a statement on agricultural policy made to the House of Commons by Mr. W. S. Morrison on May 27:

The Government proposes to initiate a large scale and more comprehensive campaign for the eradication of animal diseases in Great Britain. Our object is to improve the health of our livestock and increase agricultural productivity by seeking to eliminate what is perhaps the worst of all forms of wastage and economic loss in agriculture. In the first instance efforts will mainly be directed to the eradication of diseases among cattle. The scheme will involve an additional charge on the Exchequer of about £600,000 per annum for the first four years. It will, however, involve centralization of public veterinary services, and as against the increased cost to the Exchequer the expenditure by local authorities will be reduced by about £170,000. Parliamentary authority will be required for these proposals. The Government is anxious, however, to lose no time in developing the existing schemes of control of disease, and accordingly I am arranging at once to amend the Attested Herds Scheme under the Milk Act 1934 by providing additional assistance in England and Wales as has already been done in Scotland to owners of dairy stock who are desirous of eradicating tuberculosis from their herds. This revised scheme will become operative on June 1 next. The necessary legislation to give effect to these proposals will be introduced at the earliest possible moment."

It was subsequently explained that the whole of the inspection of livestock and diagnosis of scheduled diseases would be incorporated in the central veterinary service, but the other duties, including the work of the police, would be unaffected. The following would be transferred duties under the Tuberculosis Order 1925, routine veterinary inspection of dairy herds under the milk and dairies legislation, tuberculin tests under the Milk (Special Designations) Order, diagnostic inquiries into scheduled diseases.

Co-operation of Diseases of Animals Committees of local authorities, the police forces, the public health authorities with the central veterinary inspectorate would be essential.

Maternal Mortality Report

Sir KINGSLEY WOOD on May 27, told Mr. Hepworth that he had already taken action on the principal recommendations contained in the report on an investigation into maternal mortality. He recalled that on May 7 he addressed a circular requesting all maternity and child welfare authorities in this country to take steps to extend and improve the services already available in their areas. Sir Kingsley added that he was in communication with the Medical Research Council on the questions recommended in the report for further research.

Trade Effluents

Sir KINGSLEY WOOD in the House of Commons on May 27 moved the second reading of the Public Health (Drainage of Trade Premises) Bill. This Bill has already passed the House of Lords. Sir Kingsley said its object was to improve the purity of the streams and rivers of this country and also to relieve traders of a troublesome condition. The problem was pressing because of the tendency for manufacturers to settle on rivers which had not been industrialized before and because of the importance of conserving available sources of water supply, both domestic and industrial. The Joint Advisory Committee on River Pollution concluded in 1930 that local sanitary authorities should be under a general obligation to take and dispose of the trade effluent of their district that the trader should have a right to discharge such effluents to the public sewers and that there should be certain safeguards and conditions. This measure provided that local authorities either by agreement with traders on individual applications or by means of the enforcement of the by-laws should settle the terms on

which effluents might be discharged into sewers. These by-laws must be approved by the Ministry of Health. Traders were given a right of appeal and power was given to make exceptions to deal with particular cases. The Bill only dealt with the regulation of what might be passed through drains, as the drains themselves were regulated by the Public Health Act 1936. Provisions were included for protection of authorities who were under an obligation to treat sewage from other local authorities' areas and from docks and harbour authorities.

Mr. SHORT said the Bill was an improvement on that introduced by Lord Gainford in the House of Lords last year which had failed to reach the Statute Book. The pollution of streams and rivers by trade effluents was general and the measure was long overdue. Mr. GALLACHER said the Bill defined trade effluent as effluent with or without particles of matter, but he had in mind a coal pit which had dumped its rubbish into a harbour, and so caused pollution and desolation. Mr. MATHERS also spoke of coal dust going directly into streams from the settling ponds at collieries and said this did immense harm to rivers but did not seem to be dealt with by the Bill. Mr. DAVID ADAMS said the Tyne was really a large sewer undoubtedly highly polluted and yet no medical officer of health from the Tyneside area would state that the health of the community was in any degree affected by the fact.

Mr. R. S. HUDSON said he understood a separate Bill was needed for Scotland and was under consideration by the Scottish Office. The discharge of coal dust was already an offence under an Act passed in 1876 for the prevention of pollution of rivers. He would investigate a complaint made by a member about pollution by deposit of night soil on a river bank.

The House agreed to the Bill without a division, and it was sent to a Standing Committee.

Drinking of Methylated Spirits in Scotland

In the House of Lords on June 1 Lord KINNAIRD moved the second reading of the Methylated Spirits (Scotland) Bill which has passed the House of Commons. He said that for many years the drinking of methylated spirits in Scotland had reached dimensions which had caused grave anxiety, and the object of the Bill was to put a stop to the practice. He was informed by the largest manufacturer, who made 60 per cent of all methylated spirits that 9.5 per cent of methylated spirits was wood alcohol. Professor Sydney Smith, Regius Professor of Forensic Medicine in the University of Edinburgh had stated that it was much more toxic than ordinary alcohol owing to the fact that it took much longer to destroy the tissues. One of the most disastrous of its effects was on the central nervous system. Medical officers of health, police surgeons and others confirmed the statement that it sapped moral strength and led to greater moral depravity than did the drinking of ordinary beverages. Those who drank methylated spirits were in great danger of becoming blind and if they persisted in becoming mad.

Lord ASQUITH said that while he did not want to oppose the principle of the Bill in so far as it was concerned with stopping the drinking of methylated spirits he saw nothing in the Bill to prevent a person buying four gallons in one place and four gallons more in at least another half a dozen places. When the Bill reached committee he would put down amendments to prevent overlapping and to protect the interests of the Pharmaceutical Society of Great Britain for which an Act of Parliament was passed in 1933 and which was under the discipline of the Lord President of the Council. He did not know if the Lord President of the Council and the Statutory Committee had been consulted in regard to the Bill which implied a double testing, and the taking away of power and authority given to the Pharmaceutical Society by the recent Act.

Lord ALSTON supporting the second reading said that if the principle of the Bill was that with the least possible interference to the public they should check and regulate the use of this noxious drug. That was a sound principle.

The LARL OF MANSTFIELD said that taxation had raised the price of ordinary spirits to such an extent that many people were unable to buy them and consequently sought refuge in some nefarious substitute. Some persons tried to drink methylated spirits diluted with water, others tried to disguise its taste by mixing it with cheap red wine, which, in itself was a noxious drink, producing such mixtures as 'Red Biddy,' 'Yellow Peril' and concoctions of other colours the effects of which were very serious.

Lord STRATHCONA said that the Government's attitude was one of benevolent neutrality. It considered the Bill most desirable and that it ought to go to Committee.

The Bill was then read a second time.

Expenditure on Tuberculosis in Scotland—On May 25 Mr WILSON asked the Secretary of State for Scotland what was the annual cost for the treatment of tuberculous crippled, and orthopaedic cases. Mr ELLIOT replied that local authorities in Scotland incurred a net expenditure of £640,670 on the treatment of tuberculosis in 1934-5 the latest year for which information was available. Orthopaedic and cripple cases were dealt with by local authorities under their tuberculosis child welfare and school health schemes and a separate figure for this expenditure was not available.

Deficiency in R.A.M.C. Establishment—On June 1 Mr HORE BELISHA replying to a question said that a deficiency of sixty three regular Royal Army Medical Corps officers on the present authorized establishment was being made good by thirty three temporary commissioned officers and a number of civilian medical practitioners. The number of candidates presenting themselves continued to improve.

School Dental Inspection—On May 31 Mr LINDSAY informed Mr Lyons that during the year ended December 31 1936 3,463,948 children in public elementary schools in England and Wales were subjected to dental inspection under arrangements made by local education authorities. Of these 2,425,299 children were found to require dental treatment and 1,536,627 were treated under arrangements made by local education authorities.

Notes in Brief

The total number of houses completed by private enterprise in England and Wales with State assistance from 1919 up to March 31 1937 was 423,723. From 1919 up to March 31, 1936 local housing authorities in England and Wales completed 829,851 houses with State assistance and during the year ended March 31 1937 they completed a further 71,029 houses. The total amount of State subsidy paid in respect of the houses from 1919 up to March 31 1937 was £178,715,463.

The number of houses completed in Scotland with State assistance from 1919 till March 31 1937 was 215,537. The State subsidy paid up to that date amounted to £23,549,148.

Medical News

Founders Day will be celebrated at Epsom College on Saturday June 19. The second day of the cricket match The College v The Old Boys will begin at 11 a.m., there will be service in chapel for boys and parents at noon, an assault at arms at 2.15 and presentation of prizes by Sir Hugh Walpole at 3.30.

The annual general meeting of the London and Counties Medical Protection Society Limited, will be held at Victory House, Leicester Square W.C. on Wednesday, June 16 at 4 p.m.

The twenty sixth Oxford Ophthalmological Congress will be held in Keble College from July 7 to 10. On the morning of July 8 a discussion on the Problem of Myopia will be opened by Mr Bishop Harman and Mr Arnold Sorsby. The Doyné Memorial Lecture by the late Dr D. J. Wood of Capetown on Night Blindness in Eye Disease—Suggestions and Speculations will be read by his friend and colleague Dr R. C. J. Meyer of

Johannesburg. The full programme of the congress may be obtained from the honorary secretary and treasurer, Dr F. A. Anderson, 12, St John's Hill, Shrewsbury.

The twenty fourth centenary of Hippocrates will be celebrated this summer at Cos, Athens, and Epidaurus by a cruise organized by the Latin Medical Union (Umfia). Further information can be obtained from Dr Dartigues, Bureau de l'Umfia, 81, Rue de la Pompe, Paris 16e.

An International Congress for Short Waves in Physics, Biology, and Medicine will be held in Vienna from July 12 to 17. Further information can be obtained from the secretariat, Alserstrasse 4, Wien 9.

The sixteenth International Neurological Congress will be held in Paris from July 8 to 14, when the subject for discussion will be pain in neurology. Further information can be obtained from Dr Crouzon, 70 bis Avenue de Jéna Paris 16e.

The fiftieth Congress of the French Society of Ophthalmology will be held in Paris from June 28 to 30. Further information can be obtained from the general secretary, M. René Onfray, 6, Avenue de La Motte-Picquet, Paris 7e.

The postponed eleventh International Congress of Psychology will be held in Paris from July 25 to 31, with Professor Pierre Janet as honorary president, Professor Henri Piéron as president of the executive committee and Professor I. Meyerson as general secretary. The headquarters of the congress are at the Laboratory of Psychology of the Sorbonne.

The issue of the *Wiener medizinische Wochenschrift* for May 22nd contains a history by Dr I. Fischer of the Vienna Medical Society, founded in 1837.

The April issue of the *Bulletin de l'Office International d'Hygiène Publique* is devoted to typhus and ankylostomiasis.

Dr Donald M. Johnson has been adopted by the Bewdley Liberal Association as candidate for the forthcoming Parliamentary by-election of a member for the Bewdley Division.

Mr Alexander Maclean in handing over to Lord Horder, chairman of the Empire Rheumatism Council, at a luncheon on May 26, a gift of 10,000 guineas to finance a rheumatism research unit, said that he regarded this campaign against rheumatism as the most urgent of the needs of to-day. Mr Maclean promised a further £2,500 to the Empire Rheumatism Council making his gift £13,000 in all. He marked Coronation year by distributing a total of £40,000 to medical charities.

On behalf of the Registrar-General for England and Wales a silver medal is being struck by the Royal Mint to commemorate the centenary of the births, deaths and marriages registration service, which came into operation in 1837. The medal is to be issued to active or retired members of the department and service subscribing to the celebrations.

Dr James Fenton, medical officer of health for the Royal Borough of Kensington, has been elected president of the Society of Medical Officers of Health for the session 1937-8. Dr. Fenton is present chairman of the Central Council for Health Education, and is a past chairman of the Royal Sanitary Institute.

Professors Bezançon, Carnot, Claude, and Gosset are among the eight French leaders of the medical profession who have been nominated *Professeurs de Classe Exceptionnelle*—a distinction which counts from October 1, 1937 and which qualifies them for remaining in office till the age of 70.

The Paris University and municipal authorities have come to terms with regard to the creation of a professorship in social medicine as from October 1, 1937. The incumbent of this chair will initiate medical students in their fifth year into certain elements of preventive medicine such as sickness insurance.

Letters, Notes, and Answers

LETTERS, NOTES, ETC

All communications in regard to editorial business should be addressed to THE EDITOR, BRITISH MEDICAL JOURNAL B.M.A. HOUSE TAVISTOCK SQUARE W.C.1

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated. Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication.

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager, British Medical Association House, Tavistock Square, W.C.1 on receipt of proofs. Authors over seas should indicate on MSS if reprints are required as proofs are not sent abroad.

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Business Manager.

The TELEPHONE NUMBER of the British Medical Association and the *British Medical Journal* is EUSTON 2111.

The TELEGRAPHIC ADDRESSES are

EDITOR OF THE BRITISH MEDICAL JOURNAL *Aitology* Westcent London

FINANCIAL SECRETARY AND BUSINESS MANAGER (Advertisements etc), *Articulate Westcent London*

QUERIES AND ANSWERS

Disfiguring Pigmentation

"MB CM writes I have an elderly patient whose cheek is much disfigured by the presence of a fairly large pigmented deposit of a deep brown colour and she is naturally sensitive to its presence as it attracts attention. Will any reader suggest a form of treatment for its obliteration?"

Splitting Finger-nails

"A D K. writes in reply to 'Stumped' (*Journal* May 29 p 1144) Splitting finger nails is a form of atrophy of the nails found in conditions in which there is venous stasis in the extremities and in nervous diseases, chronic tuberculosis, nephritis diabetes, and as a chemical effect—for example after soaking the hands in soda water. For treatment a nightly application of balsam of peru 50 per cent in castor oil, to the cuticles stimulates the nail growth. Klander has had good results from a diet rich in sulphur, since the metabolism of sulphur seems to play a part in the development of nails. In the house I should advise protecting the nails with small pieces of adhesive plaster. The nails are best kept short by cutting rather than filing as the use of a file often produces further splitting.

Oxaluria

Dr VIOLET HASTINGS (Auckland New Zealand) in reply to Perplexed (*Journal* March 13 p 593) writes Dr C C Higgins of the Cleveland Clinic Cleveland Ohio U.S.A., is obtaining successful results in preventing and also in dissolving urinary calculi by diet. The treatment is a diet rich in vitamin A and the maintenance of the pH of the urine at the desired degree by the adjustment of acid and base-forming foods. Particulars of the treatment can be obtained from Dr Higgins himself.

Income Tax

Professional Subscriptions

SERVICE inquires whether a deduction for professional subscriptions can be claimed (a) by a medical officer serving in one of the armed Forces, and (b) by an officer on retired pay employed in a whole-time appointment.

* There is judicial authority for holding that such deductions are allowable under Schedule E—which is the schedule dealing with employment including Crown service—only where the individual assessed is required by the terms of his appointment to belong to the society in question. This would seem to exclude "Services" claim. The strictness of the rule was criticized in the report of the fairly recent Income Tax Codification Committee.

LETTERS, NOTES, ETC

Frars' Balsam for Dressings

Dr H KNIGHTS RAYSON (Kirkwood South Africa) writes I read with interest the remarks of Dr Charles Barber on the external use of iodine and his eulogy of frars balsam (March 6 p 540). I agree with him entirely, and although I at first used tinct iodine I soon gave it up and reverted to an old tried friend tinct benzoin. As I was ward clerk to Mr Durham at Guy's, and noted the excellent results he obtained from its use as a dressing for all he did after suturing the wound was to apply a strip of lint saturated with the drug. I could if space permitted give many illustrations of its usefulness and my advice to the young practitioner is to try it in different cases. If wounds are dirty when seen do not wash but apply it frequently and plentifully. The only trouble is it is painful on application.

Reducing by the Book

Surgeon Lieutenant D P GURD R.N. writes I have been interested to note in the *Journal* and in many magazines, advertisements which display various types of belt and abdominal supports. The prescribing of these appliances for the correction of visceroptosis and herniae or for a short period after operation, appears reasonable enough, but they are also advertised for persons of sedentary occupation as a substitute for exercise! It would appear to me that provided the abdominal musculature is of moderate development the use of such supports is contra-indicated and would, if adopted, make the muscles still more lazy. To lie supine with a heavy book on one's abdomen and to practise abdominal breathing in this position for five minutes each morning would appear to be within the capabilities of most people, however busy and is quite effective in reducing most cases of premature girth.

The A.A. Irish Handbook

The 1937-8 A.A. Irish Handbook which has been completely revised, contains a great deal of useful information for resident or visiting motorists. Details are given of inspected hotels and garages in the Irish Free State and Northern Ireland, and shipping charges to and from Great Britain are shown together with particulars of steamship routes and times of sailing. A.A. services to members are fully described and insurance information lists of car parks in Dublin, Cork and Belfast, and tables showing lighting up times and amounts of motor taxation are included, as well as summaries of the Irish Free State Road Traffic Act and motor law in Northern Ireland. Members of the Automobile Association visiting Ireland may obtain the handbook without charge on application to any A.A. office.

Gas Cooking in Hospital

A booklet illustrated with examples of modern hospitals has been published by the British Commercial Gas Association under the title "Gas Equipment for Hospital Kitchens." This can be obtained post free on application to the publishers at Gas Industry House 1 Grosvenor Place London S.W.1. It contains much of value to those on the administrative side of hospitals, clinics, and nursing homes.

Medical Golf

The seventh spring meeting of the Sussex Medical and Dental Golfing Society was held on the links of the Manning Heath Golf Club Hoveham on Sunday May 30, when twenty six members were present. The morning round for the Rolls Hoare Cup was won by Dr Craig with a net score of 69. Messrs Ditch and Thwaites were runners up with a score of 72. The afternoon round a ball against bogey resulted in a tie between Messrs Craig and A.A. Smith with a score of 8 up. Messrs Elliott J Thwaites Anderson and Wright were second with 7 up.

Disclaimer

D. VIVIAN METTIVE (Port of Spain Trinidad B.W.I.) writes The announcement in the *Trinidad Diocesan Magazine* of May 1937 which alludes to my work and in particular to an *oration* performed by me on the wife of a clergyman was in no way authorized or sanctioned by me. I know no hint of it until a copy of the magazine was sent to my wife by a friend.

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

461 Iron Metabolism in Normal Women

R M LEVERTON and L J ROBERTS (*J Nutrit* January, 1937, p 65) have investigated the iron balance in four healthy women, three aged 21 and one 27, for continuous periods of 110 days for two of them and 140 days for the other two. Food intake was adequate and controlled, and its iron content was determined, together with that of all excreta and menstrual and other blood losses (sampling epistaxis, etc). Daily records of weight and of the haemoglobin and erythrocyte content of the blood were kept. Detailed figures are given for each subject, showing iron intake and excretory loss, menstrual and other losses, and the corresponding iron balances. The mean daily intakes of iron in the food ranged from 10.03 to 13.61 mg, and the mean daily balances between iron in food and excreta from -0.2 to +1.48 mg. Although there were periods of negative and of positive iron balance, a negative balance never occurred when the daily intake of iron from food was 0.225 mg or more per kilogramme of body weight. The mean menstrual losses ranged from 11.13 to 22.84 mg of iron, corresponding to 24 to 52 c.c. of blood. The losses were relatively constant from period to period in the same subject. There was no relationship between the time of iron storage and its loss during a menstrual period, but in nine of the sixteen menstrual cycles studied the subjects were in iron equilibrium or slight positive iron balance when the menstrual losses were taken into consideration. One subject, given 5 mg. of iron as ferric ammonium citrate daily for forty-five days in the middle of the experiment, showed an increased excretion and decreased retention of iron as compared with the periods when the supplementary iron was not given. All the subjects increased the haemoglobin content of their blood by at least 1 mg per 100 c.c. during the experiment, red cell counts remained remarkably constant. The haphazard variations in the iron balances from time to time indicate that balances worked out from a few days' observations are valueless. The authors calculate that the minimum daily requirement of iron for a young woman weighing 56 kilos is 16 to 17 mg. They conclude that as the average dietary seldom contains more than 15 mg this deficiency may account for the low haemoglobin content of women's blood at present accepted as normal.

462 Artificial Pneumothorax

C M F SINDING LARSEN (*Acta med scand* Supplement, 1937, 80, p 212) has studied 1,126 sputum positive patients suffering from pulmonary tuberculosis for whom lung collapse treatment was prescribed at the Vejleford Sanatorium in Denmark between 1906 and 1932. Only in 5 per cent of all these cases was a technically effective pneumothorax induced. It was relatively effective in 11 per cent, less effective in 24 per cent, ineffective in 25 per cent (extensive adhesions preventing any appreciable collapse of the diseased pulmonary tissues), and entirely unsuccessful in 35 per cent. All the patients were traced, and 640 were found to have died. A comparison of the mortality among these patients with that of the healthy population showed it to be twelve times higher in the former than in the latter. But while this ratio was only 5.8 for the patients in whom an effective or relatively effective pneumothorax was induced it was 9.4 for the patients with a less effective pneumothorax, 27.1 for the patients with an ineffective pneumothorax, and 22.1 for the patients in whom pneumothorax was quite unsuccessful. The last two figures suggest that a partial pneumothorax which is so small as to be ineffective is likely to

do the patient more harm than good. Approximately half of all the patients developed a pleural effusion within the first six months, the percentage of such cases being as high among patients with a technically effective pneumothorax as among those in whom a pneumothorax was ineffective. These pleural effusions had no essential influence on the prognosis. The author recommends the maintenance of a pneumothorax for at least two years after it has become clinically effective, its discontinuation should be gradual and under the most careful clinical, radiological, and bacteriological control.

463 Turpentine and Ill health among Painters

G RUNDBERG (*Hygien* Stockh, April 15, 1937, p 209), under the auspices of the Swedish Government, has conducted an investigation into the health of painters, with special reference to the possibility of turpentine being responsible for at any rate part of the ill health from which they suffer. Of the 450 Stockholm painters examined 110 were found to be suffering from eczema and fifty six from slight changes in the skin which might have been a very early form of eczema. The most common ailment was conjunctivitis. Disorders of the digestive system were also common, anorexia being the most frequent complaint, while chronic gastric catarrh was diagnosed in as many as twenty three cases and gastric ulcer in seventeen. The central nervous system was also often involved, many patients complaining of giddiness, headache, and lassitude. A dry cough was observed in fifty-eight cases and albuminuria in seventeen. The author finds that there has of late been a gradual displacement of pure turpentine by cheaper and inferior products as well as by turpentine substitutes made from petroleum. His problem was therefore complicated by the variety of turpentine preparations and substitutes with which he had to deal, and it was only after an investigation lasting a year that he came to the provisional conclusion that the comparatively pure French turpentine was less injurious than the Swedish sulphate turpentine and charcoal turpentine. The manufacturers of these Swedish preparations have co-operated with him and are now proposing to adopt measures calculated to yield a comparatively pure turpentine.

464 Serum Treatment of Anthrax

I ANDREW (*Dtsch med Wschr* April 2, 1937 p 556) records his experiences in Bulgaria with 307 cases of anthrax in the five-year period 1931-5. The mortality was 7.8 per cent though if cases in which the patient was already moribund on admission to hospital were excluded it was only 4.2 per cent. Before the introduction of serum treatment the mortality was about 25 per cent. The serum was obtained from the Veterinary Bacteriological Institute of Sofia, and comparatively large doses were given by intramuscular injection, which was, as a rule, preferred to intravenous injection on account of the possibility of shock. The amount of serum given ranged from 50 to 500 c.c., and when the maximum dose was given it was distributed over two to three successive days. Serum reactions were comparatively rare and never serious. Moderately severe cases in which the general condition was not very alarming but in which merely expectant treatment had failed benefited most. As a rule the only local treatment was the application of compresses and the general treatment with intramuscular and intravenous injections of serum was supplemented by three subcutaneous injections of 5 c.c. each of oil of camphor. Among the milder cases there were no deaths and as many as 40 per cent of the severe cases ended in recovery. The author interpreted as a favourable sign

the transitory appearance of erythema about the anthrax pustule some twenty-four to forty-eight hours after the first injection

465 Thoracic Lymphogranulomatosis

F KUHLMANN and H SCHULZE-FORSTHOEVEL (*Med Welt*, April 10, 1937, p 494) have analysed thirty-eight cases of Hodgkin's disease. In a proportion of the cases the diagnosis was confirmed by a post-mortem examination. They describe the usual clinical features and the thoracic type of the disease. It appears that an early localization of the tumour in the right upper mediastinum is typical and is an important differential diagnostic sign in the early stages. Generally speaking, the disease seems to spread along the right side of the mediastinum and into the right lung. The spread seems to follow a certain definite course, which the authors present in a diagrammatic drawing

Surgery

466 Intraspinal Injections of Alcohol

A ADSON (*Minnesota Med*, March, 1937, p 135) states that the introduction of alcohol in limited amounts of various concentrations into the subarachnoid space of the spinal canal results in changes in the nerves and spinal cord the effects of which may vary from relief of pain to complete paralysis. Small quantities, 2 to 16 minims of 95 per cent alcohol, are capable of relieving pain without producing motor paralysis, and such injections are of use in the treatment of intractable pain caused by neuritis, neuralgia or a metastatic lesion. Subarachnoid injection of alcohol is especially indicated also in cases of radiculitis and intractable pruritus ani and pruritus vulvae. Vaso-spastic conditions, such as Raynaud's disease, thrombo-angitis obliterans, essential hypertension, spastic ureter, and dystonia musculorum deformans have also benefited. The patient is placed on his side with the spinal roots to be treated on the upper side. A Becton and Dickinson 1 c cm syringe is used, and a Barker 21 gauge Luer spinal puncture needle. Absolute alcohol is best, and should be sterilized in an autoclave to ensure against injection of living spores. The needle is introduced through a vertebral space just below or above the roots to be treated, and 3 c cm. of cerebro spinal fluid are withdrawn before the alcohol is injected. Following injection the patient will feel a sensation of warmth over the body, and in a few minutes pain disappears, and is sometimes followed by impairment in tactile sensations. About 6 to 8 minims is injected followed by a further injection if necessary. In thirty six cases treated, sixteen patients experienced complete relief and twelve partial relief while twelve were unchanged. It is emphasized that excessive doses and improper administration will result in motor paralysis. This method of treatment will not, of course, relieve pain of functional or central origin.

467 Volkmann's Contracture

According to F VON DANCKELMANN (*Med Klinik*, March 25 1937 p 429) ischaemia in the general sense used originally by Volkmann is the primary cause of the rare disturbance of the neuro muscular apparatus of the forearm which bears his name. It most commonly follows supracondylar fracture of the humerus less often fracture of the forearm occasionally dislocation of the elbow and very rarely haematoma formation without bone injury or displacement. It is practically confined to children under 10. More commonly coldness paraesthesia and pain are reported in the hand soon after injury and the contracture is visible when the bandage is removed during the first three weeks sometimes however there are no early symptoms and the signs develop considerably more than three weeks after appar-

ently not very serious trauma. Nerve palsies may be absent or may complicate the morbid muscular condition, and the radial pulse may be palpable or impalpable. It is certain that many cases have occurred in which plaster fixation has never been adopted. From clinical observation and animal experiments it is safe to conclude that lasting neuro muscular damage may occur within a few hours from arrest of venous circulation and the formation of subfascial haematomata. The treatment, which should be carried out whenever, in spite of correct reposition and fixation, pain persists and the mobility of the fingers is impaired, is immediate wide splitting of the fascia to diminish tension in the haematoma.

468 Mega-oesophagus

G HICQUET (*J Chir*, Brux, February, 1937, p 69) reports a case of mega oesophagus and also one of carcinoma and another of cicatricial stenosis of the oesophagus, as the comparative symptoms and radiography of the three different lesions are of interest. In the case of mega oesophagus there was gross enlargement and the oesophagus terminated in a funnel shaped dilatation which opened below into a filiform channel 5 cm in length. There was spasm of the cardia. Radiography showed that the stomach was distended and posed, and extended from the diaphragm to the pubis. Oesophagoscopy showed that the oesophagus ended in a cul de sac and no opening was visible. The opening was found after passing a bougie, and dilatation was carried out, this was continued twice a week and the patient improved considerably and gained weight. In the second case progressive dysphagia had developed and had been complete for eight days. Radiography showed that there was a neoplasm of the oesophagus with dilatation above the growth. In the third case there was difficulty in swallowing but radiography did not show any evidence of dilatation above a cicatricial stenosis. In all three cases the symptoms were the same, and were due to obstruction of the oesophagus, although this was caused by three different conditions. In cases of cicatricial stenosis there is no oesophageal spasm, narrowing develops progressively, and the part above the stricture is not dilated. In cases of spasm of the cardia the dysphagia frequently improves after one treatment by oesophagoscopy and the patient is able to swallow. In the case of mega oesophagus reported it is suggested that the spasm of the cardia and dilatation of the oesophageal wall were complementary lesions. There are many different methods of dilatation, but it is considered that oesophagoscopy is the most satisfactory and the least dangerous. By this means it is possible to wash out the oesophagus and to dilate the cardiac orifice under visual control. Treatment is carried out once or twice a week and is accompanied by marked and rapid improvement.

469 Malignant Changes in Pigmented Naevi

H HALKIN (*Paris med*, March 20, 1937, p 241) states that pigmented cutaneous epitheliomata have been studied by dermatologists, clinicians and histologists for many years. He considers that a pigmented naevus may undergo malignant changes, although it is possible for a pigmented epithelial tumour to develop on healthy skin. In the personal cases he describes it was noted that the tumour often developed at the site of a birthmark. In three cases reported the epithelioma was of the basal-celled type. In the first instance it was seen at the root of the nose where an area of pigmented skin had existed for many years. In the second the epithelioma had developed slowly on a naevus on the front of the elbow. Both cases occurred in women in the seventh decade while the third was seen in a man of 48. In another instance a small epithelioma of the scalp was treated by radiation on two occasions but continued to increase in size until it was removed surgically. Histological examination

showed a small-celled tumour, and it is suggested that, under the influence of radium a naevus of the scalp had developed into a sarcoma. In a further case an epithelioma in the region of the hip was apparently cured by means of carbon dioxide snow, but six months later one pigmented nodule developed in the scar, another a little way off in healthy skin the glands were so involved that radical treatment was impossible, and the patient died a few months later. Naevi are very common on the face, and a case is described of a small basal-celled epithelioma which recurred and spread after treatment with carbon dioxide snow, and in this case also the patient died. It is pointed out that in these three cases treatment had an irritating effect resulting in malignant changes. Many other cases are described, and it is concluded that when pigmentation is present local treatment should be avoided and diathermic excision, whenever possible, should be the treatment of choice.

Therapeutics

470 Chemotherapy in Experimental Bacillary Dysentery

K. W. JÖTTEN and G. HOLTSMANN (*Deutsch med Wschr* April 30, 1937, p. 714) report from the Hygiene Institute in Münster their experiments with the administration by the mouth of a silver compound of oxybenzylidene. Their studies were facilitated by the fact that an experimental dysentery like disease of a transitory character can be induced in hens. The drug was first tested *in vitro* on various bacilli—coliform, typhoid, paratyphoid and dysentery. Typhoid bacilli and dysentery bacilli still more, were found to be remarkably sensitive to this drug. It was then tested on hens suffering from experimental dysentery, 10 ccm of a 20 per cent solution being given by the mouth through a tube after the gastric juice had been neutralized by sodium bicarbonate. Within three to six days of starting this daily medication the stools again became solid and ceased to contain dysentery bacilli, whereas the control hens continued to pass fluid stools in which dysentery bacilli were found. In the only case in which a relapse occurred after such treatment a renewal of it was successful.

471 Placental-Extract in Measles

C. F. MCKHANN (*New Engl J Med* March 18, 1937) found that immunity following the injection of placental extract, like that following the use of convalescent serum, was passive in type and of short duration. Observations on fifty-four children re-exposed to measles within a few weeks of receiving placental extract showed that the injection was insufficient to protect for more than two weeks, and that the attack of measles was not even modified if re-exposure occurred more than three or four weeks after the injection.

472 Cod liver Oil Ointment

H. H. MUTSCHLER (*Münch med Wschr* April 30, 1937, p. 692) recommends the use of cod liver oil ointment in wounds, as originally suggested by Löhr in 1932. The treatment is successful when the following conditions are observed. The application must be copious and the treated part must be protected from contact with air. Absolute rest of the wound is important. In extensive wounds the part must be immobilized even in the absence of fracture. The dressing must not be changed too often. Occupational wounds may be left under the first dressing for two to three weeks. Other wounds should not be dressed more often than every fourth day, preferably every six to eight days. Between successive dressings the wound should be exposed to air. The treatment is also suitable for purulent wounds, osteomyelitis, badly healing amputation stumps, burns, etc.

Ophthalmology

473 Visual Sequelae of Epidemic Meningococcus Meningitis

P. HEATH (*Amer J Ophthalm* April 1937, p. 401) notes that the records of visual complications following this disease vary from 65.3 to 95 per cent. The incidence is affected by immunity, age, strain of organism, site, stage of the disease, treatment, and standards of observation. In sixty-eight cases analysed by the author the observations were made about twenty-six months after the acute stage in patients whose average age was 10.6 years. The morbidity rate was 37.3 per cent., the coccus was Type III, and the treatment was by the injection of serum. The visual disturbances totalled 161 per cent. Endophthalmitis with hypopyon was early, painless, with low tension, and led to pseudo glioma and phthisis bulbi. Panophthalmitis, iritis, iridocyclitis, uveitis, choroiditis, acute conjunctivitis, and optic atrophy were also found. Affections of the muscles vary with the site of the lesions, and when appearing early clear up well. Persistent dilatation of the pupils and inequality were seen. Only one case of optic neuritis and one of neuro retinitis were found. Many ocular complications in the acute stage were fugitive, but most visual damage was done during the early septicæmia and toxæmia.

474 Choroideremia

A. J. BEDELL (*Arch Ophthalm* Chicago, March, 1937, p. 444) remarks upon the fewness of recorded cases, none of which have been pathologically examined. Descriptions of cases going back to 1871 show night-blindness, reduction of fields, a white fundus, and lack of choroidal vessels, except in the region of the macula, where an island of choroid remains. In many a little scattered pigment, reduced retinal vessels, night-blindness, and a negative Wassermann reaction are noted. Five cases of the author's are fully documented and well illustrated, and in one transmission seemed to follow the male line. The differential diagnosis includes myopia with nyctalopia, birth injury, syphilis, retinitis pigmentosa, retinitis albens, coloboma of the choroid, and disseminated choroiditis. It would seem that in choroideremia the small vessels disappear first and the larger ones later, the venae vorticosae are attenuated and straight, the fundus pigment is partly or wholly dissolved, and the sclera becomes more visible but not ectatic, the early contraction of the field proceeds to almost complete loss. Almost all the cases are male.

475 Cirroid Aneurysm of the Retina

P. BONNET, J. DECHAUME and E. BLANC (*J méd Lyon* March 20, 1937, p. 165) describe two cases of cirroid aneurysm of the retina. They regard the condition as congenital, disagreeing with Seber, who states that the communication between the arterial and venous systems begins in the capillaries which eventually dilate sufficiently to become ophthalmoscopically visible. They believe that the larger vessels are dilated and communicate from the beginning, a proposition which does not exclude later anatomical changes such as local obliterations and haemorrhages. Variations in the colour of the blood stream in a vessel are characteristic. The dilatation of the vessels may be due to adaptation or to an inherent hyperplasia. Rarely the aneurysm exists alone, it is more commonly associated with similar lesions elsewhere as in the orbit, the facial vein or perhaps facial and cerebral veins together. In the last type the neurological symptoms predominate with signs of intracranial pressure or meningitis. The reduction of vision in these cases, apart from those in which the macula is obstructed by vascular loops, indicates a central complication, and the presence of congenital tortuosity of the retinal vessels and telangiectases.

of the face with cerebral crises makes one suspect an angiomatous intracranial tumour. Where the tortuosity of the retinal vessels is associated with telangiectases they occur on the same side.

476 Familial Hyaline Dystrophy in the Fundus Oculi

M. TREE (*Brit J Ophthalmol*, February, 1937, p. 65) writes at length and gives the notes and fields of several cases of this condition, which is also known as Dooyne's familial honeycomb "choroiditis." It appears in early adult life, there being circular greyish white or putty-coloured patches of exudate at the macular region. These patches of which the average diameter is twice or three times that of the vessels at the disk, later coalesce, and, finally, when atrophy supervenes, are associated with loss of vision. There are no other accompanying ocular lesions. The differential diagnosis from Tay's choroiditis, retinitis circinata, cerebromacular degeneration, retinitis punctata albens, disseminated choroiditis, arteriosclerotic retinitis, diffuse choroiditis, and Coats's disease is fully described.

Obstetrics and Gynaecology

477 Combined Hormonal Treatment of Pruritus

E. KLAFTEN (*Med Klinik*, April 23, 1937, p. 566) has obtained very good results in cases of pruritus and kraurosis vulvae from a combined hormonal treatment. A follicular hormone preparation is administered by injection, while at the same time the affected parts are treated with an ointment containing 50,000 international units of follicular hormone to each 50 grammes of ointment. 4,000 units are rubbed into the affected parts every day. At the same time the patient receives an injection of 30,000 international mouse units every second day. Recurrences are treated in a similar way. In cases of kraurosis vulvae 50,000 international units of vitamin A are added to the 50 grammes of the follicular hormone ointment.

478 Ovulation Syndrome

J. G. H. HOLT (*Nederl Tijdschr Geneesk*, May 1, 1937, p. 1906) under this title describes a group of clinical symptoms which in his opinion indicates the periods of fertility in women as well as other methods, and can be detected by any woman from regular observation of her own symptoms. The syndrome consists of intermenstrual pain and a number of genital, cutaneous (pruritus), psychical (irritability and depression), and intestinal symptoms (diarrhoea) including premenstrual swelling and tenderness of the breasts.

479 Hydroperturbation

B. SLAMOVA (*Zbl Gynäk*, April 17 1937, p. 938) prefers physiological saline to air in testing the patency of the Fallopian tubes. She describes a special simple apparatus used for this purpose. The advantages of this method which she calls hydroperturbation over the usual perturbation with air are as follows: the hydroperturbation is more reliable; there is no risk of air embolism; therefore the pressure may be raised up to 300 mm Hg; it allows conclusions with regard to the prognosis in each case. Pregnancy may be hoped for in every case in which the saline passes through the tubes, whereas pregnancy is in all probability impossible whenever there is obstruction to the flow of the saline. In such cases hysterosalpingography with iodized oils is indicated in order to ascertain the nature and location of the obstruction with a view to surgical operation for removal of the cause of the obstruction. Theoretically there are two objections to hydroperturbation. One is the possibility of spread of an existing infection. This danger can be eliminated by a judicious selection of cases. The second disadvan-

tage is the absence of auscultatory signs during the injection. But according to the author manometric readings during the injection of the saline are more instructive than the information obtained from auscultation during the injection of air.

Pathology

480 Experimental Haemorrhagic Syndromes

G. P. VERATTI (*Sperimentale*, December, 1936, p. 597) states that the phenomenon described by Apitz in 1930 consists of two distinct stages of a different character. The first is in the kidney, and leads to a deposit of fibrin in the glomeruli with extravasations of blood in Bowman's capsules and the convoluted tubules, which show signs of necrosis. The second is situated in the lung and is characterized by more or less extensive capillary haemorrhages without deposit of fibrin in the vessels and without any inflammatory or regressive change. The substance producing this phenomenon is principally derived from *B. coli* lysed by a bacteriophage. It is thermostable, non-volatile, and does not pass through ultra filters. A necessary condition for the production of Apitz's phenomenon is that a toxin should be introduced into the general circulation in repeated and increasing doses. The phenomenon does not occur in animals previously immunized by repeated subcutaneous and intravenous injections of bacterial extract. Transfusion of a large quantity of fresh blood from an animal in which Apitz's phenomenon is taking place into another animal has no effect even if a maximal dose of bacterial extract is injected. The phenomenon can be produced by extracts of some organisms other than *B. coli*, especially *B. paratyphosis B*, the results, however, are not always identical with those produced by *B. coli*.

481 Urine Analysis in Lung Disease

G. F. BUME and E. WERBER (*Med Klinik*, April 16, 1937, p. 539) report on the diagnostic value of biochemical analysis of the urine in 132 cases of lung disease. The products of normal cell metabolism are rapidly excreted in the urine which, containing as it does nucleoproteinase, has the property of digesting extracts made from different organs. In the case of lung extract digestion takes place if the lung is healthy, not if it is diseased. The technique of analysis is as follows: Equal amounts of the patient's urine are run into two test tubes. Acetic acid is added to one, which becomes opaque in one to three minutes. Ether is added to the other to prevent bacterial growth and the tube incubated for six hours. In patients with lung disease opacity appears in the second tube similar to that in the first. In the urine of healthy patients there is no opacity in the second tube after six hours even when acetic acid is added to it. In 130 of the specimens of urine tested the authors noted the absence of the property of the urine to digest the specific nucleoproteins of the lung. In cases of pneumonia digestion of lung extract occurred in the convalescent but not in the acute stage. The test was correct in thirty-six out of thirty-seven cases of progressive tuberculosis and in sixteen out of twenty-one assumed to be arrested. In six cases of pleurisy, three of which had a lung affection, digestion occurred in three and was absent in those associated with lung disease. In one case of bronchial asthma digestion did not occur. A reaction cannot be obtained when albuminuria is present, since the addition of acetic acid produces an opacity indistinguishable from that produced by the nucleoproteinase. The authors investigated patients' serum with the hope that it might contain nucleoproteinase but the results were too contradictory to be of value. They believe that biochemical analysis of the urine affords help in the diagnosis of doubtful cases of lung disease and that it will prove valuable in the differential diagnosis of acute and latent tuberculous infection.

In the treatment of PERNICIOUS ANÆMIA a 1937 achievement in chemistry

the purest Liver extract now available

1/10th its former dry weight

painless on injection

monthly dry dosage is now similar to the dry dosage of Insulin required by an average diabetic case over the same period

Two valuable foods compared

CALORIES	116	PROTEIN	10g	CARBOHYDRATE	10g	FAT	
19		1g		14g		1g	2g
MILK	BEMAX	MILK	BEMAX	MILK	BEMAX	MILK	BEMAX
MINERALS	12g	CALCIUM	34mg	PHOSPHORUS	157mg	IRON	
0.2g		16mg		26mg	available	Traces	17mg
MILK	BEMAX	MILK	BEMAX	MILK	BEMAX	MILK	available BEMAX
MANGANESE		VITAMIN A		VITAMIN B₁		VITAMIN D	
4.26mg		280 units		350-400		2-3 units	None
Small Traces		90 units		6 units		MILK	BEMAX
MILK	BEMAX	MILK	BEMAX	MILK	BEMAX		

The figures are for quantities of 1 oz. each of Milk and Bemax

That the Vitamin B₁ content of Bemax is 60 times that of milk is probably not surprising, but the fact that its calorific value is 5 times greater than milk, and its protein and carbohydrate content ten times as high (to quote only

three examples from the above charts), emphasises the high all-round nutritional and therapeutic value of this natural Vitamin tonic food. Special importance probably attaches to the high IRON content of Bemax.

Laboratory reports on Bemax and a clinical sample for personal trial sent on request

CARBON DIOXIDE IN GENERAL PRACTICE

To the Editor of THE LANCET

Sir—During one single hour of general-practice last week the value of carbon-dioxide resuscitation was very strongly brought home to me by three events (1) a mother with respiratory failure under chloroform during an instrumental labour (2) the child which required artificial respiration before it breathed (3) as soon as I had returned to my house a road accident in which a youth received severe multiple injuries through contact with a motor vehicle. When I arrived on the scene he was unconscious almost pulseless and his breathing nearly imperceptible. I applied a diluted carbon-dioxide air mixture under a facepiece for a few moments while I examined him. His breathing and pulse improved and he was full conscious when he was loaded into the ambulance although his injuries included broken ribs a fractured shoulder and a leg which was crushed from the thigh to the ankle. I feel confident that many of our road fatalities are due to respiratory failure within the first few moments after the accident which carbon dioxide made available by a portable supply might do much to prevent.

I am Sir yours faithfully,

Feb 17th

M B CUB FDN

STEADILY FINDING FAVOUR.

MAW STEROTHERM HOT AIR ELECTRIC AUTOMATIC STERILIZER

Patent No 427581

Maw Sterotherm Automatic Sterilizers have been installed in the London Westminster and many other Hospitals, Surgeries, etc throughout the country and are functioning with the utmost efficiency. The special features of the Sterotherm ensure complete sterilization of Instruments Dressings, Oils etc by the Hot Air method. It is the ideal unit where economy of space and outlay are essential.

May we send you details or arrange a demonstration?

SPECIAL FEATURES

- Efficient Sterilization
- Automatic regulation of temperature
- No supervision necessary while in use
- Very small current consumption
- Articles in apparatus remain sterile until required as closure is bacteria proof
- Dressings quite dry after leaving Sterilizer
- Convenient size—length 16½in diameter 9½in

SALTAIR SURGICAL SERVICE

SALT'S Patent KIDNEY BELT

A MOST EFFECTIVE SUPPORT
FOR MOBILE KIDNEY

SALT

Guarantee

"We guarantee to alter
exchange or accept the
return of any appliance
without cost ordered by
the Medical Profession
if not found suitable
within fourteen days
from date of supply"

Salt and Son Ltd.

Though SALT'S PATENT KIDNEY BELT is so consistently efficient, its design is quite simple. The principle is that of a steel spring on the outer side giving the requisite pressure on an inflated rubber pad on the inner side of the belt. This supporting pressure, being applied directly under the kidney, prevents that organ from dropping and obviates symptoms due to dragging on the renal ligaments. In SALT'S CORSET & BELT BOOK a full description of this belt is given, together with an alternative Corset form for patients who prefer such a support. Both this Book and a special Pamphlet on 'Movable Kidney' will be sent post free to any Doctor who requests same.

It's no advertising humbug to say that Aertex Cellular underwear is healthier. It's just common sense. Everyone knows the story of the gilded child in the papal procession dying in convulsions due to suffocation, the body breathes through the pores and obviously an underwear woven into millions of tiny air-cells protects and insulates its wearer against extremes of heat or cold, keeps him or her fresh and cool in muggy weather and generally helps to avoid chills. Complete 1937 catalogue gladly sent on request.

LOCAL EDUCATION AUTHORITY

ASSISTANT SCHOOL MEDICAL OFFICERS.

Applications are invited for TWO ASSISTANT SCHOOL MEDICAL OFFICERS in the Department of the Medical Officer to the Local Education Authority at a salary in each case of £500 per annum rising by annual increments of £25 to £700 per annum.

(Where a successful candidate holds a similar appointment under another Local Education Authority and receives a salary in excess of the advertised minimum a commencing salary of not less than the salary which the candidate is receiving under his (or her) existing appointment (not exceeding the maximum under the Liverpool Scale) may be paid.)

Candidates must be registered medical practitioners, and must have had at least three years' experience. It is desirable that they should have had some special experience in school hygiene and in diseases of children.

The Officers appointed will be required to reside within the City and devote whole time service to the Local Education Authority under the direction of the Medical Officer to the Local Education Authority and will not be allowed to undertake any private practice.

The appointments will be subject to the Local Government and Other Officers Superannuation Act, 1922 and the Standing Orders of the City Council.

Form of application which may be obtained by forwarding a stamped addressed foolscap envelope should be returned together with copies of three recent testimonials to the undersigned not later than June 21st, 1937 and endorsed Assistant School Medical Officer.

The canvassing of Members of the Education Committee or the City Council is strictly prohibited and will be considered a disqualification.

W. H. BAINES, Town Clerk and Clerk to the Local Education Authority, Municipal Buildings, Liverpool 2, June 4th 1937.

THE KING EDWARD VII WELSH NATIONAL MEMORIAL ASSOCIATION

Applications are invited from duly registered medical practitioners (male and female) for the post of ASSISTANT TUBERCULOSIS MEDICAL OFFICER (resident) at the Sully Hospital, Sully, Glam (300 beds) for the treatment of pulmonary tuberculosis) situated between Penarth and Barry.

Salary £500 per annum rising by annual increments of £25 to £700 per annum less the value of emoluments amounting to £100 per annum.

Preferable candidates should have had six months' resident experience in a special institution (Hospital or Sanatorium) for the treatment of pulmonary and/or non-pulmonary tuberculosis with eighteen months' experience in general clinical work of which six months should have been spent in a hospital not confined to the treatment of tuberculosis. Experience in anaesthetics also desirable.

The person appointed to the above post will be required to pass a medical examination and to contribute 5 per cent. of his salary to the Superannuation Fund of the Association. Applicants not already in the service of the Association must be under 45 years of age.

Applications stating age, qualifications, experience etc. together with copies of three recent testimonials should reach the undersigned not later than Wednesday June 16th 1937.

Memorial Offices, D. A. POWELL, Westgate Street, Cardiff, Principal Medical Officer

CITY OF PLYMOUTH

CITY HOSPITAL, 370 Beds

DEPUTY MEDICAL SUPERINTENDENT

Applications are invited from fully qualified male Medical Practitioners for the post of Deputy Medical Superintendent at the City Hospital, Plymouth. The appointed candidate will work under the direction of the Medical Superintendent. The duties are mainly medical and candidates should have had medical experience and preference will be given to candidates possessing a high medical qualification.

Salary at the rate of £400 per annum with full residential emoluments.

The appointment will be held during the pleasure of the Council and will be subject to:

(1) The candidate passing a medical examination in accordance with the provisions of the Local Government and Other Officers Superannuation Act.

(2) Six weeks' notice on either side. The Officer will be required to attend the Council all fees at wages and emoluments, other than the fees received by him. Forms of application may be obtained from the undersigned and should be returned accompanied by copies of not more than three recent testimonials not later than June 21st, 1937.

T. PIERSON, Medical Officer of Health, Town Hall, Plymouth

COUNTY COUNCIL OF MIDDLESEX

DISTRICT MEDICAL OFFICER AND PUBLIC VACCINATOR HAMPTON WICK

Applications are invited from duly qualified Medical Practitioners for the undermentioned appointments

District Medical Officer for the Hampton Wick Medical Relief District. Salary £50 per annum plus the cost of expensive drugs and fees in respect of attendance at confinements and for the services of another medical practitioner to administer short anaesthetics for minor operations (e.g. septic finger abscesses).

The officer appointed will be required to carry out his duties in accordance with the Public Assistance Order 1930 of the Minister of Health to reside in the district unless the Council otherwise determines and to name to the Council some duly qualified Medical Practitioner who will in the case of his absence or other hindrance to his personal attendance act in his place.

Public Vaccinator for the Hampton Wick Vaccination District. The person appointed will be required to produce to the Council a certificate of proficiency in vaccination, except in a case in which such certificate was required as a condition of obtaining any diploma, licence or degree which he possesses. He will be required also to enter into a contract with the Council in accordance with the Vaccination Order 1930 of the Minister of Health. The contract will provide for the payment of the scale of fees laid down by the County Council.

The person or persons engaged will not have any superannuation rights under the Council's superannuation scheme.

Applications stating date of birth, qualifications and experience in vaccination, together with not more than three recent testimonials must be received by the undersigned not later than June 19th 1937. Relationship to any member or officer of the Council must be disclosed in the application. Application forms are not provided. Envelopes must be endorsed "District Medical Officer and/or Public Vaccinator as the case may be". Canvassing directly or indirectly will be a disqualification.

C. W. RADCLIFFE, Z.
Middlesex Guildhall, Clerk of the County Council
Westminster S.W.1
May 29th 1937

COUNTY COUNCIL OF MIDDLESEX

NORTH MIDDLESEX COUNTY HOSPITAL, EDMONTON

JUNIOR RESIDENT ASSISTANT MEDICAL OFFICER

Applications are invited for the above appointment. Salary £250 per annum, with board, lodging and laundry. Candidates must be registered Medical Practitioners who have held resident appointments in a general hospital.

The appointment which will be subject to medical examination is for a period of six months with the option of renewal for a further period of six months. If desired and on the recommendation of the Medical Superintendent and subject to confirmation by the Council for promotion to the post of Assistant Medical Officer. If not so appointed he will leave the Council's service.

The officer appointed will work under the direction of the Medical Superintendent and will devote his whole time to his official duties.

Applications stating age, qualifications and experience together with copies of not more than three recent testimonials must be received by the undersigned not later than June 16th. Application forms are not provided. Envelopes must be endorsed "Junior Assistant Medical Officer North Middlesex County Hospital". Relationship to any member or officer of the Council must be disclosed in the application.

Canvassing directly or indirectly will be a disqualification.

Town Clerk

June 12 1937

METROPOLITAN BOROUGH OF STEPNEY

APPOINTMENT OF AN ASSISTANT TUBERCULOSIS OFFICER

Applications are hereby invited for the appointment of an Assistant Tuberculosis Officer and Assistant Medical Officer of Health in the Borough. The person appointed will also be required to carry out such other duties as the Medical Officer of Health may from time to time determine.

The person to be appointed must possess the Diploma of Public Health as well as the qualifications prescribed by the Local Government (Qualifications of Medical Officers and Health Visitors) Regulations 1930 with not less than two years' experience in a sanatorium or other tuberculosis institution or otherwise in whole-time work in relation to tuberculosis. He must be experienced in artificial pneumothorax treatment.

The salary will be at the rate of £600 per annum rising by annual increments of £25 to a maximum salary at the rate of £700 per annum.

The person to be appointed will be required to devote the whole of his time to the duties of the office act under the direction and supervision of the Medical Officer of Health and pass an examination by the Council's Medical Referee as to constitutional fitness. The appointment will also be subject to the provisions of the Stepney Borough Council (Superannuation) Acts 1905 to 1931 and to the Council's bye-laws. The appointment will moreover be for a probationary period of six months in the first instance.

Forms of application may be obtained from the undersigned to whom they must be returned in envelopes endorsed "Appointment of Assistant Tuberculosis Officer" so as to reach him not later than 12 noon on Saturday June 19th 1937.

Canvassing members or officers of the Council is strictly prohibited and will disqualify candidates. The Council do not bind themselves to appoint any of the candidates.

Municipal Offices, By Order
Raine Street, W. McCARTY
Old Gravel Lane, Town Clerk.
London E1 June 1st, 1937

COUNTY BOROUGH OF DONCASTER

ASSISTANT MEDICAL OFFICER

Applications are invited for the appointment of an additional Assistant Medical Officer (Woman) to the duties of the appointment will be chiefly in connection with the Maternity and Child Welfare and School Medical Services, but in addition the person appointed will be required to carry out such other duties as the Medical Officer of Health may assign to her.

The salary will commence at from £500 to £550 according to experience and will increase annually by £25 to £700 per annum.

The appointment will be held subject to three months' notice on either side and to the following conditions—

(1) The officer appointed must be a registered medical practitioner below the age of 45 years and must devote the whole of her time to the duties of the office.

(2) She must hold a recognised qualification in Public Health and have previous experience in 17 cases of Children and in the treatment of Venereal Diseases. In addition she should either have held a previous approved appointment as a Medical Officer of an Ante Natal Clinic or have had at least three years' experience in the practice of her profession including special experience of practical midwifery and ante natal work.

(3) She will be required to reside within the Borough.

(4) The appointment will terminate on marriage.

(5) The successful candidate will be required to undergo a medical examination in the appointment by a panel of three members of the Local Government and Other Officers Superannuation Act 1922.

Applications on forms obtainable from the undersigned must be received by him together with three recent photographs not more than three months old, not later than June 15th 1937. The successful candidate will be required to pass an examination by the Council's Medical Referee as to constitutional fitness. The appointment will also be subject to the provisions of the Doncaster Borough Council (Superannuation) Acts 1905 to 1931 and to the Council's bye-laws. The appointment will moreover be for a probationary period of six months in the first instance.

- 1 UNOPPOSED COUNTRY PRACTICE WITHIN 150 MILES OF LONDON—Sited in attractive district and producing for the past 12 months £1 500 including £600 p.a. from Panel and £200 from Clubs and Public Assistance. Excellent house recently re-decorated with 3 reception and 6 bedrooms. Beautiful garden and orchard. Rent on lease £65 p.a. Good scope for further development. Local hospital. Vendor on Staff. Premium 2 years purchase.
- 2 LONDON—WESTERN DISTRICT—Old-established Private PRACTICE for disposal after being held for many years by the Vendor who is retiring. Approximate cash receipts for the last year amount to £1 062. There is stated to be scope for increase, particularly if Panel work is undertaken and also midwifery. Fees 3/6 to 10/6. Small compact house available on rental at £90 p.a. containing consulting room, 2 reception rooms, 3 bedrooms etc. Premium £1 800.
- 3 ESSEX—Death Vacancy—Old-established PRACTICE for disposal. It has been held by the Vendor for the past twelve years. The gross cash receipts for the last year were approximately £756. Panel of 424 patients. Fees 2/6 and 3/6 with a few midwifery cases at 3 guineas. Suitable house for disposal containing 2 reception rooms, 3 bedrooms, etc.
- 4 DEATH VACANCY—FAVOURITE SOUTH COAST TOWN—Old established PRACTICE producing £800 p.a. of which about £600 is derived from a Panel of 1,200 patients, and an appointment producing about £30 p.a. House with 3 reception, 4 bedrooms, etc. to be rented on lease. Premium £1 500 to include household fittings and fixtures.
- 5 SOUTH-COAST SEAPORT—Long-established PRACTICE for disposal owing to Vendor's retirement. He has held it for the past 39 years. Income last year approximately £573 with a Panel of about 460 patients. Vendor previously held a public appointment producing £450 p.a., which he relinquished owing to age limit. It is considered that anyone devoting whole time to the Practice would increase the receipts. Suitable accommodation available on rental.
- 6 HAMPSHIRE—VILLAGE PRACTICE NEAR COAST—Recently established Practice producing at the rate of about £260 p.a. and stated to be capable of considerable extension. Very nice small house to be rented on lease.
- 7 EASTERN COUNTIES—Mixed-class PRACTICE in pleasant agricultural district producing for last 12 months over £1 300 p.a. Fees 3/6 to 2/1. Nice house in good position with 2 reception, 4 bedrooms, dressing room etc. Separate professional accommodation. Modern conveniences. Garden garage. Price for freehold £1 300. Sport of all kinds and schools within reach.
- 8 MONMOUTHSHIRE—Middle-class PRACTICE established 20 years and producing for last 12 months £1 430 p.a., including small Panel of about 300. Fees 3/6 to 2/1. Good house with 2 reception, 6 bedrooms, etc. Separate professional rooms. Garden garage. Rent £125 p.a. Premium 14 years freelease.
- 9 EAST ANGLIA—WITHIN REACH OF TWO GOOD TOWNS—Old established unopposed country PRACTICE averaging over £1 000 p.a., including Panel producing over £450 a year. Low expenses. Detached house in own grounds, containing 2 sitting rooms, 5 bedrooms, etc. Rent £70 a year. Premium £1 750.
- 10 NORTH WALES—Chiefly working-class PRACTICE producing for last 12 months £1 025 including Panel worth £438 p.a. and appointments worth over £400 p.a. Low expenses. Suitable surgery premises for sale. Premium, to include surgery, £2 050.
- 11 LONDON—NORTH WEST—Recently established and steadily developing PRACTICE producing for last 12 months approximately £1 000 and increasing at the rate of about £200 p.a. Suitable house can be rented or flat obtainable. Premium 2 years purchase.
- 12 DEATH VACANCY—CUMBERLAND—Old-established unopposed PRACTICE held by late incumbent thirty years. Gross cash receipts average about £800 p.a., including Panel worth over £250 p.a. and appointments worth nearly £80 p.a. Suitable 2-roomed house with bathroom, surgery, dispensary, etc., garden, garage. Rent £30 p.a. Shooting fishing golf etc. Premium offers invited.
- 13 LONDON—SOUTH WEST—OUTLYING SUBURB—Old-established good middle-class PRACTICE averaging between £1 150 and £1 500 p.a. including Panel of about 1 300. Suitable house with 2 reception, 4 bedrooms, etc. can be rented at £80 p.a. Premium 2 years purchase or near offer. Illness reason for sale.
- 14 EASTERN COUNTIES—Very sound unopposed middle and working-class PRACTICE in agricultural district averaging £1 150 p.a. including Panel worth about £450 p.a. Fees from 3/6. Nice house with 2 reception, 6 bedrooms, etc. electric light garden garage. Premium for Practice and house £3 350.
- 15 NORTHERN SUBURB WITHIN 10 MILES OF HYDE PARK—Recently established better-class PRACTICE, steadily increasing and producing for last 12 months £760. Panel of about 600 and appointments worth £40 p.a. Good freehold, 1½ storey with 4 bedrooms, etc. garden, garage. Price £1 450. Premium £1 400 for near offer. Vendor retiring.
- 16 LONDON—SOUTH WESTERN DISTRICT—Well-established middle-class PRACTICE. Gross cash receipts for last 12 months approximately £800 including Panel of £250. Fees from 2/6. Suitable house stated to be in good repair. Good scope for increase. Moderate premium.
- 17 EASTERN COUNTIES—COUNTY TOWN—Well-established PRACTICE averaging about £1 100 p.a. including Panel of 1 051 and clubs producing about £150. £400 p.a. Very nice single storey house with 4 bedrooms and sits on a beautiful site with a large garden. Premium 1 year's purchase.
- 18 LONDON N.W.—Recent established PRACTICE at present producing £200 p.a. but capable of great increase. Fees from 3/6 to 10/6. House available on rental at £45 p.a. could be well used as a kitchen. Premium 1 year's purchase.
- 19 OUTLYING NORTHERN DISTRICT—Recently established PRACTICE at present producing over £340. Suitable house on rental at £90 p.a. Premium £350.
- 20 ESSEX COAST TOWN—PARTNERSHIP—A share producing about £1 500 p.a. is offered in a very sound and increasing, mixed-class Practice at present bringing in about £4 000 p.a. with substantial Panel. Suitable house with 2 reception, 5 bedrooms etc. Small garden garage. Rent £120 p.a. Premium 2 years purchase.
- 21 SOUTHERN COUNTIES—Well established non-Panel PRACTICE producing about £3 000 p.a. Fees from 5/1. Suitable house can be rented.
- 22 NORTH EAST COAST—Old established PRACTICE producing about £900 p.a. but stated to be capable of considerable increase. Choice of houses. Partnership introduction given as vendor retiring.
- 23 EAST COAST TOWN—PARTNERSHIP—A share worth about £1 000 p.a. is for disposal in an old-established Practice the gross cash receipts of which are about £4 000 p.a. House containing 3 or 4 bedrooms with garden and garage can be rented at £90 p.a. Premium 2 years purchase.
- 24 MIDLANDS—FAVOURITE RESIDENTIAL TOWN—Chiefly better class non-dispensing PRACTICE, producing for last 12 months over £1 600. Panel of 560 and one appointment worth £150 p.a. Fees 3/6 to 2/1. Very nice house with ample accommodation garden and garage. Freehold for sale. Premium 2 years purchase.
- 25 SOUTH EAST COAST—RESIDENTIAL TOWN—Old-established non-dispensing better-class PRACTICE averaging for last 3 years about £1 450. Selected Panel of 500. Fees 3/6 to 2/1. Ground floor flat containing large hall consulting room, 2 reception, 3 bedrooms, etc. inclusive rent £190 p.a. Premium 2 years purchase.
- 26 CENTRAL LONDON—PRACTICE is worked as a 'Lock up' and averages about £1 000 p.a. Fees from 2/6. Suitable accommodation can be obtained. Premium 2 years purchase.
- 27 CROYDON AREA—Recently established PRACTICE. Receipts for last 12 months over £660 including Panel of 350. House with 3 bedrooms, etc., garden and garage can be rented at £85 p.a. Premium £750.
- 28 OUTLYING NORTHERN DISTRICT—Mixed-class PRACTICE receipts last 12 months £1 250 including Panel of 1 000. Suitable flat above surgery premises. Inclusive rental £184 p.a. Premium 2 years purchase.
- 29 SUSSEX—ATTRACTIVE DISTRICT NEAR SEA—PARTNERSHIP—A ONE-FOURTH SHARE in old-established Practice having good scope. Gross cash receipts for last 12 months approximately £3 275. Panel of about 1 300. Appointments worth over £300. Choice of houses on rental for incoming partner. Premium 2 years purchase.
- 30 SURREY—RAPIDLY DEVELOPING AREA—Recently established PRACTICE producing for last 12 months £720 including Panel of 680. Suitable house can be purchased. Moderate premium. Ill health reason for sale.
- 31 NORTH LONDON—Old-established PRACTICE producing about £700 p.a. including Panel of nearly 600 patients. Suitable house ample accommodation and good garden garage to rent at £100 p.a. Premium £1 200.
- 32 LONDON—WESTERN AREA—Mixed-class PRACTICE in populous district. Gross cash receipts for last 12 months about £700, but capable of increase. Panel of 500. Well situated house with ample accommodation, will be put into thorough repair. Good garden. Price for Practice and house £2 300. £500 down.
- 33 SUSSEX COAST TOWN—PRACTICE established 45 years for disposal owing to retirement of Vendor. Present receipts about £600. There is stated to be scope for increase as receipts have fallen owing to Vendor's illness. Panel about 650. Large house can be rented at £150 or purchaser could probably choose own residence.
- 34 LONDON SOUTH EAST—Old-established PRACTICE producing about £1 850 p.a., including selected panel of 500. Fees from 3/6. Suitable house available with 2 reception, 5 bedrooms etc. Freehold for sale. Premium 2 years purchase.

SPECIAL NOTICE

The Commission payable on Sale of any Practice or Partnership where the Bureau is Sole Agent is limited to FIFTY POUNDS exclusive of house property.

REVISED TERMS ON APPLICATION

MAGSYN

MAGNESIUM-SYNERGIZED ASPIRIN

Magsyn is a preparation of basic magnesium acetylsalicylate in the form of tablets. Its advantages over uncombined aspirin may be summarized as follows:

The effect of the aspirin is enhanced,

The dose of aspirin necessary is therefore lower

The tolerance of the stomach for the aspirin is increased. Dyspeptics have found that they do not experience digestive disturbance after taking Magsyn.

The tablets have a distinctive shape, the aspirin is disguised, and its nature may, therefore, be kept secret from the patient.

The combination has a rapid effect in headaches.

It is specially suitable for children because of the small dosage of aspirin.

Each tablet of Magsyn contains 7½ grains (0.5 gm) of basic magnesium acetylsalicylate.

Descriptive literature on request.

DOSE

Adults—One to three tablets

Children—Half to one tablet. To be chewed or swallowed with plenty of water.

TWO SANDOZ PRODUCTS OF NOTE IN THE FIELD OF NEUROLOGY

FEMERGIN

RELIEVES AND ABORTS
MIGRAINE ATTACKS

Clinical experience of recent years has provided ample proof of the fact that no other drug has given results so uniformly successful as has Femergin (ergotamine tartrate) in the treatment of migraine. Even patients who have long been subject to migraine attacks, often of great severity, have in the majority of cases, obtained almost miraculous relief following the administration of Femergin.

Femergin is most effective when given early in an attack but even fully developed seizures are often relieved in one or two hours. The dosage should be varied to find the smallest amount that will be effective, but generally 0.25 to 0.5 cc. by hypodermic injection will suffice to abort or cut short an attack. In mild cases satisfactory relief may be obtained by the oral administration of two tablets.

BELLERGA

CONTROLS AUTONOMIC
HYPEREXCITABILITY

Bellergal is the treatment of choice of autonomic nervous disorders. It is based on the new conception that such disorders are seldom purely vagotonic or sympathicotonic but are most frequently amphotonic in character, *i.e.*, accompanied by disturbance in both divisions of the autonomic nervous system.

By the combined action of Femergin inhibitor of the sympathetic, Bellafoline, inhibitor of the parasympathetic, and phenobarbitone sedative of the central nervous system, Bellergal not only controls peripheral autonomic overaction but also exerts a valuable sedative action on the higher centres.

The normal daily dose is 4 tablets, of which one tablet should be taken in the morning, one at mid-day and two in the evening.

DIGEST OF TREATMENT

General Editor **GEORGE E. REHBERGER, M.D.**

VOLUME 1

JULY, 1937

No 1

Through Digest of Treatment the busiest physician can learn the latest developments in treatment by spending a few spare minutes. If he is interested in filing any one digest he will find it simple to tear out and a convenient size to fit into any notebook.

It is a monthly periodical designed to meet the needs of every practising physician or teacher of medicine.

Each month the Editorial Staff combs over 200 medical journals to get the newest and proven material to be digested and put into easily read form for the practitioner.

Each issue contains 40 to 45 digests.

Only those articles having some particular value to medical treatment and practice are selected.

Material in each field is selected by physicians in actual practice well acquainted with clinical problems.

It is of convenient pocket size. Each article with few exceptions will be complete on one tear sheet (two pages standard length), easily kept by tearing out a single page.

Unbiased selection of current opinions concerning the newer drugs are a feature.

Each issue contains an editorial by an outstanding man in the medical world.

ENTIRELY NEW and ORIGINAL BOOK

SCHUMANN'S OBSTETRICS

WRITTEN from EXPERIENCE—and by a TEACHER

This is an *absolutely new book* written out of an experience of many years in private and hospital practice, and presented with that clearness that comes from teaching experience

The book is well balanced. Greatest consideration is given to the diagnosis and treatment of those more common conditions and complications that are met in the general practice of the family physician. Both *non-operative* and *operative procedures* are presented, but by far the greatest emphasis is placed on non-operative procedures because these are the ones most frequently called into practice by the physician in his daily work. There are 581 instructive illustrations on 497 figures, many of them picturing the procedures or the technique step by step.

You will find this new book unusually complete, decidedly up to date

Dr. Schumann has contrived to write a textbook of obstetrics which covers the whole aspect of the subject with great thoroughness. At the same time he has produced a book which is not only a pleasure to read but also a study. The illustrations are of a high standard, well reproduced and adequate in number. It will not only appeal to students and post-graduates but also to the general practitioner.

—The Journal of Medical Sciences
an achievement of the first rank. The chapters follow each other in a natural sequence and by the time one is given to conditions and diseases generally considered of minor importance at the student and practitioner.
—Medical Times & Herald

A FEW FEATURES OF THIS NEW BOOK

Signs and symptoms of pregnancy arranged by weeks in order of appearance

Three biologic pregnancy tests in detail which are astonishingly accurate and have rendered this diagnosis one of the most certain in medicine

Management of pregnancy—complete and full with specific guidance on just what to do at first and at subsequent visits

Analgesia and anaesthesia, a full discussion with indications, contra-indications, agents to be used at each stage and the method of using them

Conduct of labour—duties of patient, preparation for home delivery, preparation of physician and what he should do at each stage

Toxaemias of pregnancy—with an extended discussion of pernicious vomiting, eclampsia including the Arnold Fry treatment and therapeutic abortion

Placenta praevia—a fine chapter with 14 illustrations and a treatment table giving time of pregnancy, condition of cervix, type of placenta praevia and the treatment indicated under the existing factors for both primiparae and multiparae

Chapter on maternal illnesses accidental to pregnancy including the entire acute range of common diseases

Pathology of labour—a very clear presentation of each pathological condition and complication telling and showing what exactly should be done to meet these conditions

Puerperal sepsis—the greatest single cause of death in the child-bearing women. A 21 page chapter six of the pages being on treatment alone including immunotransfusion

Five conditions which must be fulfilled before forceps can be applied with safety. Then the type of forceps, technique of its use

Caesarean section, covering 23 pages with 26 illustrations

And at every stage, a sound background through a clear understanding of anatomy and physiology

Octavo of 780 pages with 581 illustrations on 497 figures. By EDWARD A. SCHUMANN, A.B., M.D., F.A.C.S., Professor of Obstetrics, University of Pennsylvania. Cloth 27s. 6d. net.

There are 581 instructive illustrations in this New Book

Face Presentation The correction of chin in hollow of sacrum. Pressure on the shoulder has rotated the foetal body the head following and the chin coming into an anterior position

order to stand at 10/-
SPECIAL REDUCED PRICE 10/-
GEORGE BORWICK & SONS LTD. 15, B. & F. Lane, London, E.C.4. (Telephone 2541 & 2542)

THE FILTER TIP WILL KEEP THEM FIT

Because of its double function, the "du Maurier" filter tip has become a really important factor to smokers—specially to those with a tendency to sensitive throat. Each "du Maurier" has a five layer filter made up of pure white vegetable tissue interleaved with cellulose fibre. The filter allows no bits in the mouth and isolates all irritants. This filter is a feature on both the plain tip 'medium' and the cork tip.

du MAURIER

the perfect cigarette with the exclusive filter tip

TEN FOR SIXPENCE • TWENTY FOR ONE SHILLING

LESLIES ZŌPLA

STRAPPING is available on elastic cloth as well as the usual cloth

Thoroughly reliable under all conditions

A Popular Strapping
High Quality Low Prices

Strongly self-adhesive White or flesh cloths

Manufactured by *SAMPLES ON REQUEST*

LESLIES LTD, Higham Hill Rd, Walthamstow, LONDON, E17

ZŌPLA-BAND

(Zōpla Elastic Plaster Bandage)

The ideal treatment for varicose ulcers, sprains, etc

Material is very elastic, cream or flesh cloths

ZŌPLA ON WHITE FELT

is coming to the fore Used as a padding and for protection Does not become hard in use, and is long lasting Many thicknesses and compressions

**EFFECTIVE SUPPORT WITH
FREEDOM AND COMFORT**

The advantages of the Curtis Abdominal Support No 1 lie in its anterior - posterior pressure By this method the lower abdomen is effectively supported while the hips are given complete freedom of movement This, combined with its scientific design and extreme lightness in weight, makes the Curtis Abdominal Support No 1 the most efficient and comfortable on the market

*A little
booklet— with a big
purpose*

This booklet contains valuable information concerning the many useful functions of the crepe bandage in every day cases. Written by an eminent medical authority it is a handbook well worth possessing. The Norvic crepe bandage known and recommended for its remarkable elasticity which is arrived at by a special weaving process does not contain rubber in any form. It is given special mention in this interesting booklet. POST FREE on application to—

LIGHTER APPLIANCES for Summer wear

In hot weather there exists a great temptation for patients to discard their appliances for the sake of greater comfort. However this risky procedure is quite unnecessary nowadays because SALTS can make Belts, Corsets, and Stockings in their wide range in a light-weight material which is at all times cool and comfortable. Though the use of such material effects a generous saving in weight, no loss of efficiency is entailed, indeed the lighter appliance is identical with the Winter model in the matter of providing essential support for the condition under treatment. A further advantage of possessing an alternative appliance lies in the fact that the Winter model can be released for cleaning or repair, thus lengthening its useful life and offering a distinct appeal to one's sense of economy.

SALT'S CORSET & BELT BOOK gives full details about these Light-weight Appliances.

"CERABAN"

ADHESIVE
SELF-SUPPORTING

BANDAGE

The Supplementary or Alternative Treatment to Self Adhesive Elastic Bandages for
SPRAINS, DISLOCATIONS, CONTUSIONS, SWELLINGS, VARICOSE VEINS, VARICOSE ULCERS, etc

Its use eliminates the risk of Dermatitis which so frequently arises from the application of Self adhesive Bandages

CERABAN " whilst free from rubber, possesses elastic properties and when carefully applied to the limb gives substantial support. It is porous, adhesive and non-irritating will not chafe and permits of complete respiration of the skin.

In the treatment of Varicose Ulcers the use of "Ceraban" Bandage eliminates the risk of Dermatitis which occasionally occurs through the application of self adhesive Elastic Bandages. In the less severe of such cases a distinguished authority writing in the *Lancet*, page 580 Sept 7th 1935 issue recommends the use of "Ceraban" Bandage cut in strips as a first and protective dressing prior to covering with self adhesive Elastic Bandage and in the more serious cases the complete replacement by Ceraban. It is waterproof, antiseptic and being spread on an extensible material readily conforms to the shape of the limb and therefore will not slip.

IN THE PAST 6 MONTHS 51 HOSPITALS HAVE TESTED
AND APPROVED OF THE **BAXTER "VACOLITER"**
THEY FIND THIS SERVICE
UNIFORM • SAFE • ECONOMICAL

PROVED

Before a single litre of Baxter's solutions was sold to the profession generally there was a history of five years of research plus two years of development, then three years of successful clinical use by a selected group of hospitals. We could not afford to guess — nor can you. Baxter's solutions in Vacoliters are always sterile, ready to use and instantly available. We have been able to prove to many hospitals that they bring the advantages of safety and improved service at reduced cost.

TESTED

Solutions in Vacoliter dispensers are prepared from a fractionated protein-free water. Their pH value is always consistent with their concentration. Baxter solutions are stable and sealed in vacuum and sterilized under recorded control. Each time a new solution is made up it is biologically tested. We ask you to give them a thorough clinical test. What you find out for yourself will be more eloquent than any claims we could possibly make.

RHINITOL

MISCIBILITY - ENSURES

The Nasal Compound
in which
EFFICIENCY

and the maximum of benefit from a minimum of Ephedrine

"I would like to express to you my appreciation of the value of your Rhinitol Increased preparation I have for many years suffered from a winter catarrh beginning with a Naso-pharyngeal about October or November and usually lasting as a semi-chronic nasal and bronchial until I go on my summer holidays. I started about October with one of your samples by putting a few drops in each nostril morning and evening and I am glad to say that for the first time in over twenty years—I am now nearly sixty—I have gone through the winter without a cold." B.D.H. SEX HORMONE PREPARATIONS

OESTROFORM *A standardised preparation of the ovarian follicular or oestrogenic hormone*

Oestroform has been used with signal success in various metabolic derangements of ovarian origin, in menstrual disturbances of puberty, amenorrhoea, menopausal disorders and excessive vomiting of pregnancy, also for the induction of labour

GONAN *The gonadotropic substance from pregnancy urine*

Gonan is administered in dysmenorrhoea and in many cases of secondary amenorrhoea, also in certain cases of metrorrhagia and hypomenorrhoea

PROGESTIN B D H *The hormone of the corpus luteum*

Progestin B D H is responsible for the control of many of the phenomena of pregnancy and menstruation, and it is administered with success in habitual abortion, amenorrhoea, dysmenorrhoea and menorrhagia

TWENTY-FIVE per cent. **HOVIS**
of the flour from which the
loaf is produced is wheat germ

Science advocates the use of germ-bread as a factor in promoting nutrition. That is why HOVIS figures so prominently upon the dietary when the question of food value must be studied. In white bread, the wheat-germ is practically non-existent. This vitalising source of protein, fats and phosphates abounds in HOVIS. In fact, twenty-five per cent of the flour from which the HOVIS loaf is produced, is WHEAT-GERM. Apart from its low starch-content, HOVIS is practically free from bran and indigestible cellulose. This factor makes HOVIS supreme for easy digestibility and assimilation.

VITAMIN 'B' CONTENT . HOVIS 2.600 WHOLEMEAL 1.450
WHITE BREAD 200

Ergoapio (Smith)

A Menstrual Regulator . . .

When the periods are irregular, due to constitutional causes, ERGOAPIOL (Smith) is a reliable prescription. Containing apiol (M.H.S. special) together with ergot, aloin and oil of savin of the highest quality, this preparation effectively stimulates uterine tone and controls menstrual and postpartum bleeding.

In cases of Amenorrhœa, Dysmenorrhœa, Menorrhagia and Metrorrhagia, Ergoapio serves

as a good uterine tonic and hemostatic. Valuable in obstetrics after delivery of the child and for the menstrual irregularity of the Menopause.

Prescribe 1 to 2 capsules 3 or 4 times daily. Supplied only in packages of 20 capsules. Literature on request.

As a safeguard against imposition the letters M.H.S. are embossed on the inner surface of each capsule, visible only when the capsule is cut in half as shown.

CONTRAMINE

(diethyl ammonium-dithiocarbamate)

Contramine is particularly valuable in the treatment of the chronic complications of gonorrhœa and metallic intoxications following the administration of arsenic, bismuth or mercury. Gonococcal arthritis, chronic epididymitis, conjunctivitis, iritis, neuritis, teno-vaginitis and fibrositis, all of which conditions may complicate gonorrhœa, are indications for Contramine.

Chronic retrobulbar neuritis and amblyopias, as well as bismuth and mercurial stomatitis, yield to treatment with Contramine. Various dermatoses, such as acne (vulgaris and rosacea), seborrhœic eczema and dermatoses of varied or unknown origin, as well as such rheumatic conditions as gout and lumbago are considerably benefited also by treatment with Contramine.

SUMMER COLDS

The Summer season in Great Britain is fortunately free from epidemics of coryza associated with serious sequelæ. Owing to our fickle climate summer colds are however fairly widespread and cause considerable inconvenience to the victims. People returning to the germ laden atmosphere of towns after spending holidays at the seaside or in the country often succumb to attacks of coryza which off-set to some extent the beneficial effect of the holiday.

Since GENORA brand ORAL VACCINE for COLDS and INFLUENZA was introduced to the Medical Profession experience has shown that a course of this vaccine establishes a high degree of immunity. It is particularly suited for

the prevention and treatment of summer colds as the product is taken by the mouth and thus obviates the inconvenience associated with hypodermic injections. Clinical results and laboratory tests demonstrate that the antibody response is cumulative as the agglutinin titre rises week by week.

For cases with a history of frequent coryza and chronic bronchitis we recommend giving the Oral Vaccine at regular weekly intervals over a considerable period the dose ranging from 10 c.c. to 20 c.c. according to circumstances. By this method an immunity to colds is gradually built up and bronchitic symptoms materially decrease.

Additional information regarding GENORA brand ORAL VACCINE for COLDS and INFLUENZA will gladly be supplied on request.

"LACTOGEN" as easy to Assimilate as Natural Milk

The special Lactogen process ensures a product so closely akin to the characteristics of natural milk that not only are the proportions of its food elements practically identical, but the physiological character is also similar in every important factor.

The fat globules, through homogenisation, are even smaller than those of breast milk, whilst the curd is just as light and flaky as that of the natural milk.

For these reasons Lactogen is as readily digestible and as assimilable as Baby's natural diet — and the food you are safe in recommending in cases where breast feeding is inadequate or impossible.

OVALTINE

IN PREGNANCY

THE physiological drain of calcium, phosphorus, vitamins and other important food elements calls for replacement during pregnancy. Composed of milk, eggs and malt 'Ovaltine' supplies these essentials in a delightful form which does not overtax the unstable maternal digestion. A cup of 'Ovaltine' on arising during the early months is often effective in controlling sickness and has a food value greater than three eggs.

IN LACTATION

To maintain lactation to the eighth month is an ideal not often realized under modern conditions of life. Ample evidence is available to show that 'Ovaltine' has a definite action in increasing the flow and enriching the quality of the milk. It has moreover a beneficial effect on the health of mother and child. The flavour is so agreeable that it can be taken for prolonged periods without any distaste arising.

Uralysol, in addition to being a solvent and eliminator of pathological Uric Acid is a powerful urinary antiseptic.

Normally there exists in the body a certain quantity of uric acid which assists general metabolism and after it has played its part is eliminated together with the normal thyminic acid of the organism. When however uric acid is present in excess the body needs additional thyminic acid to supplement the resultant deficit of this normal solvent of uric acid.

Uralysol, by its thyminic acid content, supplies the agent necessary to dissolve excessive uric acid.

The next step is the elimination of this thyminic uric acid which being in excess of normal necessitates treatment by an agent capable of enhancing elimination.

Uralysol, by its content of hexamethylenetetramine and lysidin stimulates the organism to eliminate the pathological uric acid already dissolved by its thyminic acid content.

CHRONIC PSORIASIS

Complete cure after local treatment with
Peat Ointment

This letter came to us from a doctor the other week
Dear Sirs

I am very pleased to report that a young married woman patient has been completely cured of a very long-standing Chronic Psoriasis by the use of your Sphagnol Ointment.

I can state that this is very remarkable as this patient has been under treatment for years in private and Hospital and Sphagnol is the only preparation that has brought lasting relief. Her skin today is as soft and clear as in her childhood days. Now, to a 35-year-old extremely grateful patient, recovery has caused a great deal of pleasure.

Yours very truly,
(Signed) W.B. C.E. FREPS

Though neither dangerous nor painful psoriasis is still a great annoyance. Usually correcting faults of clothing and diet will give relief but sometimes local assistance is necessary. Then regular applications of Sphagnol Ointment which contains the healing principles of peat will generally clear up the skin in a very short time.

If you are not familiar with Sphagnol preparations please let us send you free samples.

COLLOSOL BRAND PHOSPHO-MANDELATE

(for Urinary Sterilisation)

IN A NEW PACKING

This new and simple treatment for urinary infections, embracing cystitis and allied disorders, completely supersedes the difficult and nauseating ketogenic diet and consists in first rendering the urine acid by the administration of ammonium phosphate and then giving mandelic acid, the fluid intake of the patient being restricted to maintain as high a concentration of the acid in the urine as possible. The cost of the 6-days treatment is 5/-.

Suitable test papers with comparison tints of different pH levels are also supplied.

Full particulars upon request.

JUNO ONE OF THE GREAT DEITIES OF THE ROMAN PANTHEON PERFORMED IMPORTANT FUNCTIONS IN THE REALM OF MAGICO-RELIGIOUS THERAPEUTICS. THE STATUE HERE REPRODUCED REPRESENTS THE LATIN JUNO SOSPITA OF LARUVIUM. —Juno as the female principle in human life became the tutelary deity of woman, protecting and healing her as need. As the patron of the female sex, a Juno accompanied each woman (as a Genetrix accompanied each man) throughout life. The final general conception of the goddess was the result of a combination of a number of local deities of her name including Juno Sospita, Juno of the goddess of Laruvum, and Juno Lucina, the chief goddess of childbirth, the goddess of the child's youth and maiden. Juno Regina was the goddess of marriage and the family.

AGAROL allows measured and uniform dosage

AGAROL pours freely—as should all good emulsions. Fill the spoon for measured and uniform dosage. Or if preferred, place the dose in a glass with water, stir, and take it that way. A pleasing drink it is, too. For children, add it to milk—and they like it.

■ Agarol is the original mineral oil and agar-agar emulsion with phenolphthalein. It affords easier and more thorough mixing with the intestinal contents. It offers greater palatability, absence of oily taste, and greater convenience in use. There is no sugar in Agarol, no artificial flavouring for the patient to get used to.

■ The treatment of constipation is much less of a problem when you rely on the dependable action of Agarol for thorough softening of the intestinal contents, for evenly distributed lubrication of the intestinal canal, and for gentle stimulation of the peristaltic function.

- Samples to the medical profession only
- A request on your letterhead will bring you a complimentary supply.

ABNORMALITIES OF GROWTH AND DEVELOPMENT THE CLINICAL AND PATHOLOGICAL ASPECTS*

BY

H. GARDINER-HILL, M.D., F.R.C.P.

Physician to Out-patients St Thomas's Hospital

GROWTH AND DEVELOPMENT IN THE NORMAL

The curve of growth in normal children is far from uniform and a wide range of individual variation occurs. Many attempts have been made to formulate average standards, but such curves in relation to individuals must not be interpreted too strictly. The growth rate in a child at any particular instant is the resultant of a number of different factors. The influences of heredity, sex, and environment must be taken into consideration to mention only a few. Nevertheless, the construction of average growth curves has served a useful purpose and has shown that in the normal there are certain rhythms to be found. The study of an average growth curve shows faster and slower periods and these alternate in a quite consistent way. This would be generally accepted and the chief difference of opinion is as to the number of such waves which occur. Some authorities refer only to two, but it is usual to consider three. Robertson (1923) writes of three growth cycles, each composed of a period of gradual acceleration, peak, and retardation. The first is to be observed in the first year of post-natal life, the second with its peak at the sixth or seventh year, and the third the adolescent spurt. Stratz (1922) and Harris (1933) also speak of three springing-up periods, each followed by a filling-out period. Skeletal growth precedes muscular and visceral growth in each case; the chronological timing of the cycles in their curve corresponds to that of Robertson's. Rapid growth during the first year is followed by a slower and steadier period until the second peak between 5 and 7, which corresponds to the second dentition. Then the child becomes thinner and the limbs

That heredity exerts a profound influence on the growth of individuals is a matter of common observation, whilst all who deal with children are conscious of the variations sex induces too. A study of average growth curves brings out this point quite clearly. The fast growing period in girls starts sooner, finishes earlier, and is less intensive than in boys. Girls in fact grow more steadily until puberty, when growth is more likely to slow down. Boys on the other hand often grow rapidly throughout their teens, a fact to which no doubt can be attributed the greater average stature of man.

Differential Growth

The occurrence of different rates of growth in the various parts of the skeleton must be briefly considered for this accounts for the changing skeletal proportions found as growth proceeds. One of the characteristics of the infantile skeleton is a shortness of the limbs in comparison with the trunk. If in the normal child measurements are made from symphysis to vertex and symphysis to soles before the 6th or 7th year, it will be found that the lower measurement is less than the upper. At about the time of the second dentition, the second growing-up period, the limbs as has already been mentioned, begin to lengthen in relation to the trunk. In fact at this stage the infantile skeletal proportions merge into the adult type and from then onwards until puberty growth in the limbs is in excess of that in the trunk, with the result that the lower measurement after the age of about 7 or 8 exceeds the upper. The transformation can be accounted for in the following way:

confirms the clinical view that during the active growth period, activity in the limb bones is considerably in excess of that in the vertebral column and greater below than above the knee. This accounts for the observed fact that in normal children the bodily proportions change during this period from those of the infantile to the adult type.

The Growth Cartilages as the Site of Longitudinal Growth

In considering the development of the bony skeleton in its relation to longitudinal growth our chief interest lies in the growth cartilages of the long bones and in those of the vertebral column. It is now generally accepted that all growth in length takes place at the growth cartilages rather than interstitially. New bone is added to the ends of the diaphyses of the long bones and to the upper and lower surfaces of the vertebrae by successive additions at the growth cartilages. Hunter's (1837) classical experiment with lead shots in the tibia of a growing pig disproved the theory of interstitial growth, for when the bone had increased in length by the growth of the animal the two shots were found to be still the same distance apart. Harris has adduced further evidence to disprove the interstitial theory by following radiologically the progress in a growing child's long bones of individual lines of arrested growth. Transverse striations individually identified remain parallel and equidistant as they travel up the shaft.

Structure and Changes in Growth Cartilages During Growth

A brief consideration of the changes occurring in the growth cartilages during normal growth is essential to an understanding of the pathological variations found in the abnormal. The whole subject has recently been fully reviewed by Harris (1933b) to whom we are indebted for many original observations. Cartilage is essentially a vegetative tissue in which the cells are arranged in columns. They proliferate in a relatively avascular matrix. Their nutrition depends largely on tissue juice diffusion, for the vascular arrangements in the epiphysis and metaphysis are only relatively effective. The vessels, moreover of the epiphysis from the vascular circle around the joint and those of the metaphysis, from the main vessels of the shaft have no free communication. Proliferation of cartilage cells occurs by fission. In the actively proliferating cells mitosis has been demonstrated by Harris (1933c) by special staining methods. The arrangement of the cells undergoing mitosis is in the form of a ring at the head of the bone and from this ring, traced centripetally to the epiphysis and centrifugally to the diaphysis, three zones of gradually maturing cells can be found. In the zone next the ring the young cells are arranged in columns or palisades in the middle zone enlarged and degenerate cells with calcified matrix occur and in the zones furthest from the ring those next to the diaphysis and in the centre of the epiphysis osteogenesis is proceeding. Conditions of nutrition become gradually more and more difficult for the cells removed from the ring and this is heralded by calcification of the matrix. Subsequently the calcified matrix is removed by an irruption of blood vessels carrying osteogenic cells the function of which is to deposit bone. Osteogenesis can be compared to an acute inflammatory process whereby the senescent cartilage as a virtual foreign body is replaced by highly vascular bone. We thus arrive at the arrangement of an ossification centre in the epiphysis and an area of ossifying cells in the metaphysis replacing new bone laid down at the end of the shaft. In between and at the junction

are the young cartilage cells, which continue their activity throughout the period of active growth. On these, growth in length of the long bone depends.

An essentially similar process occurs in the vertebral column, and the bodies of the vertebrae grow by addition of bone to their superior and inferior surfaces. In one respect does this process differ from that in the growth cartilages of the long bones, in that the number of cells in the cartilage columns is fewer. Moreover, the secondary centres of ossification take the form of an annulus of bone, and it is only the periphery which is ossified. Thus annular epiphyses are formed which in due course unite with the bodies of the vertebrae and limit the growth in length of the vertebral column.

Factors Influencing Growth

It is difficult to enumerate the factors influencing growth for they are many and ill defined. In the first place the nature of the growth impulse inherent in living things is entirely unknown. Of all the phenomena in the realm of growth this inherent tendency of living organisms to grow is the most remarkable. Yet it has recently been demonstrated by experiment that if the anterior lobe of the pituitary is removed an animal may continue to live but not to grow, unless anterior pituitary implantation is performed or anterior pituitary feeding instituted.

Not only is the power of growth inherent in the living cell—and it has to be remembered that living cells will grow and multiply by division under appropriate conditions even if separated from the organism of which they are part—but they retain *in vitro* the power of growth and differentiation to produce form. Fell (1928-9) has successfully grown in a small tissue chamber the early limb buds of the chick. The isolated fragments from the proximal part of the limb grew and differentiated in the tissue chamber so that the various features were reproduced as in the living organism.

Heredity

Of the influences affecting growth some appear to be predetermined by inheritance and others to result from internal or external circumstance. In man the hereditary growth tendency has been linked up with the endocrine constitution of the individual. Racial gigantism and dwarfism for instance have been related to the activity of the pituitary. Though endocrine constitution is determined largely by heredity the recent work of experimental embryologists suggests that endocrine influences are not the main cause of racial peculiarities of this type. Harrison (1935) and others for instance, in their experimental work on the transplantation of limbs, have shown that under the same endocrine environment limbs and other structures from two species of different sizes will respond differently and according to their inherited growth capacity. The chief factor in the production of hereditary racial types seems to be genetic constitution.

Anterior Pituitary Growth Hormone

Of the hormones of the endocrine glands influencing growth that from the anterior lobe of the pituitary is all important. In fact its effect on general growth seems to predominate over that of the other endocrine secretions. Its discovery is due to Evans and Long (1921). Striking increase of growth has been reported from its injection into normal rats and the rate of growth in rats dwarfed by hypophysectomy has also been restored. It appears to

produce its growth stimulating effects specifically on the tissues, and also affects development through the intermediation of other glands—the thyroid, adrenals and sex glands which are under anterior pituitary control. This interaction of the endocrine glands well known but only partly understood is another complicating factor in our elucidation of their respective growth influences.

There is no definite information yet as to the mode of action of the anterior pituitary growth hormone, either on the tissues in general or on the growth cartilages, though Evans (1933) observes that the failure of the bones to increase in length after hypophysectomy is apparently due to failure of development of the cartilage cells in the epiphyseal disks. It would seem that the growth hormone has a stimulating effect on the growth of cartilage as on the other tissues of the body. Normal animals show a strikingly increased appetite and food consumption under its influence. The experiments of Lee and Schaffer (1934), using the paired feeding method of Mitchell (1929–30), have demonstrated that normal rats treated with growth hormone increase their body substance more than controls given the same food. Other experiments have shown that the results of growth hormone administration depend on at least two factors—dosage and "receptivity" of the tissues. The latter varies much in different species. Evans (1935) again, has demonstrated that whereas dogs—the dachshund and the shepherd-dog—give a marked acromegalic response to injections of growth hormone other species of animal—for example the rat and the rabbit—do not readily do so. Evans (1935a) has also pointed out that there is in responsive animals a maximum reaction which cannot be exceeded, and that when this has been arrived at multiplying the dose by two or ten times makes no difference. The limit of the body's capacity to grow has been reached and apparently the limit of the body's capacity to utilize the hormone. At no time has a rate of growth in excess of the most rapid growth known for post-natal life been induced, nor does a rapid rate continue indefinitely under growth hormone administration.

Thyroid

The thyroid gland is known to exert a considerable influence on growth and development, and recent experimental work has shown that it is under anterior pituitary control. This relationship makes it difficult to assess the importance of the thyroid itself in normal growth processes. The results however of thyroid extirpation and feeding in young animals make it clear that in the absence of the thyroid normal growth cannot continue. The chief action of thyroxine is as a metabolic stimulant, and under its influence all cells of the body are stimulated to increased activity. Aldrich (1936) has pointed out that this accounts for its stimulating effect on general growth for in young animals any process which tends to increase activity of cells must of necessity stimulate growth. Theoretically in immature organisms differentiation must be hastened as well. This is borne out by experimental observation for thyroid feeding in tadpoles produces premature metamorphosis. Although growth is temporarily stimulated, stature is limited and miniature frogs result. From a quantitative standpoint therefore the thyroid hormone stimulates growth only temporarily. From the qualitative point of view it is extremely important at all times. Without it normal development and function cannot be attained and this applies to the growth cartilages of the skeleton as to other tissues. Without thyroid function growth and development are retarded.

Thymus

Recent experimental work points also to the thymus as having an important influence on growth and development, for Hanson (1936) and his co-workers have shown that in rats thymus extract, when administered intraperitoneally and continuously through successive generations of parents, leads to striking acceleration of growth and development of successive generations of young. The young of the third and succeeding generations are said to grow and develop physically at a remarkable rate. They do not, however, become giant rats, as the rapid rate of growth decreases from the second month on. It is possible that the continuance of thymus injections through several generations may provide the key to these results. These experiments have been adequately controlled but further confirmation must be obtained before the influence of the thymus on growth and development can be accepted as proven.

Sex Hormones

The influence of the sex hormones on growth an apparently indirect effect by inducing maturity and controlling the time of fusion of the epiphyses will be considered in the next section. The part of the adrenals and pineal and their relation to sex precocity will be considered subsequently too.

External Factors

Of external factors influencing the growth process climate, season food and disease play important parts, and of these the last two are of most significance.

Vitamins

Our knowledge of vitamins and their influence on growth has been due to the work of Hopkins (1912) and Mellanby (1921) in this country and Hess (1930), McCollum (1927) and their co-workers in the United States. The presence of small amounts in the food of vitamins A, B, C, and D is essential for normal health and deprivation of any one of them results in complete cessation of growth. In addition to their influence on general growth they exert specific effects on certain tissues—vitamin A, for instance on epithelial structures, vitamin B on nervous tissue, vitamin C on the vascular system and vitamin D on cartilage and its calcification. Experiments have demonstrated that young rats fed on a satisfactory diet but deficient in vitamin A grow for a short time only and then cease to put on weight and gradually go downhill. They are especially liable to succumb to intercurrent infections. The presence of vitamin B is equally important, for young rats fed on a diet otherwise satisfactory but deficient in vitamin B also immediately stop growing and develop digestive and a number of other symptoms. Harris (1926) regards the functions of vitamins A and B in the general growth process as essentially different, the fat soluble A vitamin being chiefly concerned with differentiation—that is a specialized function (the differentiation of osteoblasts, for example)—the water-soluble vitamin B being concerned with vegetative function (growth promotion, for instance). Moreover he would employ the term "anti infective," introduced by Green and Mellanby (1928), in regard to vitamin A only in so far as the fully differentiated cell is less susceptible to disease than the poorly differentiated cell, whether it be in the conjunctiva of the eye or bone.

The influence of vitamins C and D is more apparent on specific growth processes. In the absence of vitamin C capillary haemorrhages occur, and in infantile scurvy may

be found at the diaphyseal capillary loops, the resulting extravasation of blood tending to disrupt the calcified cartilage and newly formed bone. Vitamin D, on the other hand, in the presence of a normal calcium-phosphorus ratio is essential for the calcification of cartilage, and in its absence the growing animal or child develops rickets.

Diet

Of the importance of diet in the production of normal growth there can be little doubt, and many observations could be cited in support of this view. To quote a recent illustration, the work of Corry Mann (1926) may be mentioned. He showed that an additional daily allowance of a pint of milk considerably increased the rate of growth of boys. By control experiments he proved that this enhanced rate of growth was not due to the correction of any absolute deficiency, either in the total energy value of the diet or in the magnitude of its protein, carbohydrate, or fat content. The Scottish Board of Health (1928, 1929) later repeated this work and obtained similar results. At the same time it showed that skimmed milk had almost the same stimulating effect on growth as whole milk, an observation which appeared to rule out the possibility that its fat-soluble vitamins were concerned. It would be interesting to speculate on the nature of the growth-promoting constituent of milk, but here perhaps it is sufficient to recall the work of Hopkins (1912) and his followers. They showed that certain proteins yielded on digestion essential amino acids without which growth could not take place. Animal protein, particularly in the form of whole milk, cheese, eggs, fish, and meat was necessary in the diet in order to provide the essential amino acids.

Factors Limiting Growth

It is a well-established fact that, in the normal, limitation of longitudinal growth is closely associated with activation of the reproductive system. With the advent of sexual maturity, closure of the epiphyseal junctions occurs and longitudinal growth ceases. The essential feature appears to be a maturation and senescent change in the growth cartilage, proliferation ceasing whilst ossification of the epiphyseal disks occurs. How the sex gland hormones produce these effects is not known at the present moment but the phenomenon would seem to be analogous with the changes of maturity which occur in the body as a whole as a result of their agency. As yet experimental evidence from the administration of gonad extracts has not been reported no doubt because active preparations of the sex hormones have only recently become available. Evans (1935b), however, mentions a significant result in his experiments with puppies. A preparation of growth extract contaminated with gonadotropic hormone and inadvertently given produced not only a growth effect but activation of the reproductive system in a hypophysectomized animal. Although the growth response was rapid epiphyseal ossification occurred shortly after the resulting oestrus and growth ceased. Though other experimental observations of this type are still lacking there is considerable evidence from castration in animals and in human beings of the relation between the sex hormone and epiphyseal fusion. Not only does the castration of cocks result in increased length of limbs with retarded ossification of the epiphyseal cartilages but similar results have been obtained in dogs, horses and cattle. Castration before maturity in man also results in excessive growth of the long bones with unossified epiphyseal cartilages as shown by the investigations of Launois and Roy (1904).

Tandler and Gross (1910), and many others. Clinical observations in eunuchoidism support these experimental results, whilst cases have been reported of the opposite condition of precocious puberty in which premature fusion of the epiphyseal junctions has occurred. There can be no question that activation of the reproductive system is of paramount influence in limiting normal growth, and now that the sex hormones have become available for experimental work it should not be long before their mode of action on the growth cartilages is revealed.

Though sex gland maturity plays the dominating part in epiphyseal fusion under normal conditions, there are other influences, notably infective and metabolic diseases, which have a similar and sometimes pronounced effect in limiting the growth of the skeleton. These influences have been suspected in the past, but recently Harris (1933d) has provided convincing histological and radiological proof of their mode of action. He finds that the growth cartilages are inordinately sensitive to illness, and that during the period of growth any serious interference with nutrition, from starvation, acute infection, or metabolic disease, may induce changes of premature senescence. The fact is registered in the structure of the bone by a transverse line of arrested growth. This is essentially a defensive mechanism in the bone, and when the child is ill or starved the growth cartilages cease to proliferate and become heavily calcified. When growth is resumed the line appears as a scar in the bone and can be demonstrated radiologically. Such lines, he finds, differ histologically only in extent from the lines of complete cessation of growth which appear as a result of the final calcification of the epiphyseal junction. Moreover, if the noxious stimulus, metabolic deficiency, or disease is sufficiently severe complete ossification of the growth cartilages may occur prematurely. Such a condition has been found not infrequently in children who during the second decade have suffered from a series of severe infections, particularly the exanthemata, in quick succession, and this has resulted in dwarfism.

It may be concluded, therefore, that the chief factor in limiting growth in the normal is activation of the reproductive system, which appears to produce its effect by some as yet unstudied process of maturation in the growth cartilages. The influence of disease may produce similar changes—senescence of cartilage cells, with ossification and premature epiphyseal fusion.

GIGANTISM

The condition of gigantism may be defined as a general symmetrical overgrowth of the body which differs only from physiological development in that the length of the body and size of the viscera exceed considerably the average measurements peculiar to the race. For many years clinicians have held the view that the explanation of this anomaly was an overproduction of growth hormone by the anterior lobe of the pituitary. The site of production of this hormone, moreover, was thought to be the eosinophil cells as many cases of gigantism were associated either with eosinophil adenomata or eosinophil hyperplasia of the anterior pituitary. The correctness of this hypothesis and the presence of growth hormone in the anterior lobe was not, however, demonstrated for certain until Evans and Long (1921) reported the experimental production of gigantic rats by long-continued intraperitoneal injections of anterior lobe extracts. The growth curves of the treated animals showed a steady continuance of growth as opposed to the customary slowing or "plateau" of growth in the untreated controls as they

reached adulthood. The weight of the treated animals as against their litter-mates was doubled. The giants were symmetrically proportioned. Radiological examination or preparations of the osseous system showed that proportions of one and a half times the normal were attained. Thus experimental confirmation of the relation between the anterior pituitary and gigantism in man was obtained. No source of growth hormone preparations other than anterior lobe tissue has yet been discovered, and it seems likely that for true pathological gigantism to occur an excessive activity of the anterior lobe eosinophil cells during the active growth period is necessary.

It is usual to classify gigantism into the simple hereditary and endocrine types and of the latter there are two groups—the acromegalic and the hypogonadal. The great majority of giants belong to the endocrine group, and their abnormal development is due to hormonal disturbance of growth.

Simple Hereditary Gigantism

Simple hereditary gigantism should not be regarded as a pathological condition for, apart from excessive stature and macrosomia, neither the skeleton nor other organs of the body show any evidence of disease. It is essentially an inherited characteristic and is dependent on chromosomal constitution. In many of the recorded instances of this form of gigantism hereditary influences on both sides of the family have been pronounced. It is attractive to speculate on the degree of pituitary eosinophilia in these individuals but the work of experimental embryologists (already mentioned) must be borne in mind. Harrison (1935) and others have shown that under the same endocrine environment limbs or other structures from two species of different sizes will respond differently and according to their inherited growth capacity. It would appear, therefore, that genetic constitution is the main influence in simple hereditary gigantism.

Acromegalic or Hyperpituitary Gigantism

The view has long been held that hyperfunction of the anterior pituitary before puberty leads to gigantism and afterwards to acromegaly, and it is now generally accepted that the skeletal changes in gigantism and acromegaly are expressions of a similar pathological influence occurring at different periods of life. Massalongo (1892) first suggested that acromegaly was delayed gigantism, and Brissaud and Meige (1895) emphasized that the diseases were essentially similar but of different periods—adolescence and adult life. Later Launois and Roy (1904) pointed out that gigantism was acromegaly in individuals with unossified epiphyses. The experience of clinicians since that time has certainly emphasized the close relation between the two conditions for it is a well-established fact that many giants sooner or later acquire acromegalic features whilst acromegalics sometimes show manifestations of gigantism. Pathological investigations too have shown the essential similarity of the pathological processes, for not only are gigantism and acromegaly associated with hyperplasia or more commonly, adenomatous tumefaction of the eosinophil cells of the anterior pituitary, but in both conditions a visceral splanchnomegaly occurs with hyperplasia or adenomatosis of the thyroid gland and adrenal cortex. In the light of recent experimental work this is what would be expected from hyperfunction of the anterior lobe for in addition to its growth hormone it also secretes thyrotropic and adrenotropic hormones.

Any insecurity in this clinico-pathological interpretation that gigantism and acromegaly were due to over activity

of the anterior pituitary may be said to have ended with the experimental production of gigantic rats and of acromegalic dogs. The experiments of Evans and Long (1921) in producing gigantic rats with growth hormone given parenterally have already been considered—Evans (1935c) has suggested that if one could learn to close prematurely the epiphyseal disks of rats one might hope to make them acromegalic, but the rat is an animal whose epiphyses never close. On the other hand, he has found that in the shepherd-dog by administration of the same growth extract which caused symmetrical gigantism in the rat, typical acromegalic features could be produced. He considers that while some animals notably the rat and the rabbit, do not become acromegalic, others such as the dog readily do—an instance of differing reactions of the body tissues of different strains to the same substance. Does it not seem probable that similar constitutional peculiarities may explain the differing reactions of human beings to excess of growth hormone—that is the varying combinations of acromegaly and gigantism found in man?

Although there have been many examples of gigantism recorded in the literature it must be regarded as a rare condition. Cushing (1927) points out that this is due to the fact that adenoma formation characterizes adult life and that pre-adolescent hyperpituitarism associated with an eosinophil adenoma is a rarity. In his series of sixty-five verified cases of acromegaly all showed an excess of this type of cell but true acromegalic giants were rare. In Bailey and Davidoff's (1925) analysis of a consecutive series of 100 cases of hyperpituitarism there was only one example of a true giant without acromegalic features, though in a few of the patients the disease had started early enough to produce increase in stature. This individual began to grow rapidly at the age of 13, and by the age of 21, when he was under observation, had attained a height of 6 ft 8 in. His bodily proportions were normal. This man had bodily features similar to those produced in experimental gigantism. The pituitary tumour was a typical eosinophil adenoma.

Judging by recorded instances it would seem that hyperpituitary gigantism usually starts at the time of puberty, and is characterized by very rapid skeletal growth during the next few years. Sooner or later the presence of the pituitary tumour causes headache and other neighbourhood symptoms. In most cases hyperpituitary giants have not been as strong as their size might indicate and, as Cushing says, some of them present hypopituitary symptoms before they die.

The stature of recorded cases has varied from 7 ft 6 in. to 8 ft 6 in. (the famous giant in Trinity College, Dublin). Rösle (1917) states that authentic instances of human giants of 9 ft cannot be established.

Hypogonadal or Eunuchoid Gigantism

A clinical relation between gigantism and sex gland deficiency has frequently been observed, and the latter is thought to be an important factor in the overgrowth of these cases. In some castrates considerable height is attained, but overgrowth when it is found in the eunuch is seldom sufficient to warrant the use of the term "gigantism". It can readily be appreciated that delayed fusion of the epiphyseal junctions such as is characteristic of eunuchoidism would favour the production of gigantism in the presence of anterior lobe eosinophil activity. In hypogonadal gigantism it is usually assumed that there are two factors present encouraging overgrowth: first, the lack of the restraining influence normally exerted by the sex glands, and, secondly, pituitary eosinophilia.

Although the clinical features of eunuchoid gigantism favour a primary hypogonadal aetiology, and in some instances the pathological findings a congenital gonadal hypoplasia, recently acquired knowledge that the sex glands are activated by the anterior pituitary gonadotropic hormones probably from the basophil cells, suggests that the gonadal deficiency in eunuchoid gigantism may have arisen primarily in the anterior pituitary too. It has, in fact, been suggested that the growth and sex hormones of the anterior pituitary are mutually inhibitory, but no direct proof of this has been obtained. A knowledge of the histology of the anterior pituitary in conditions in which the growth-sex relationship is disturbed is obviously important, but up to the present this information has not been forthcoming. Differential cell counts in the normal anterior pituitary have been studied under varying circumstances and at different periods of life. Roughly the eosinophil-basophil cell percentages correspond with functional demands. During active growth periods the eosinophil cells reach their maximum, whilst at the time of sexual maturation the basophils are increased. Nothing definite however is known of the eosinophil-basophil cell relation in hypogonadal gigantism.

Clinically the cases reported have had their onset in adolescence and been characterized by disproportionate length of the limbs as compared with the trunk, infantile genitalia, and an absence of the secondary sex characteristics and of the acromegalic accompaniments found in hyperpituitary gigantism. The stature attained by hypogonadal giants is not as a rule as great as in the hyperpituitary type.

In review, the outstanding features of pathological gigantism may be reconsidered. In the first place, the most important aetiological factor in the conditions described has been an anterior lobe pituitary eosinophilia with over-production of growth hormone. As yet no other endocrine secretion has been shown to have similar effects. Our knowledge is still lacking as to the possible effects of over nutrition and hypervitaminosis as factors in producing overgrowth.

In hyperpituitary gigantism the growth and differential growth curves are essentially an exaggeration of the normal. General symmetrical overgrowth is the characteristic feature though in some instances localized overgrowth in the form of acromegalic changes may be in evidence too. The clinical picture closely approaches that of experimental gigantism in animals produced by administration of growth hormone. In hypogonadal gigantism an additional feature favouring overgrowth is present—delayed closure of the epiphyses. In these individuals the growth curve in adolescence is prolonged beyond the normal and often far into adult life. Disproportion of the skeleton, unusual length of limb as compared with the trunk results from a failure of the growth cartilages to undergo the changes of maturity at the usual time.

At the present moment the mode of action of the sex hormones in producing changes of maturity in growth cartilages and of the anterior pituitary growth hormone in stimulating this tissue is not understood.

MACROSOMIA PRAECOX

Some insight into the factors concerned in growth and development can be obtained from a study of a comparatively rare group of conditions in childhood in which transitory overgrowth accompanies precocious development of the reproductive organs. These pathological states are usually included under the heading of macro-

somia praecox or macrogenitosomia praecox owing to their common and predominant features, somatic and genital precocity. It is important to recognize that, although such children appear remarkably overgrown when they come under observation, they do not in adult life exhibit gigantism. In fact in cases which survive to adult life the reverse is usually found—premature closure of the epiphyses, associated with early maturation of the reproductive system, has resulted in cessation of longitudinal growth long before the usual age, and they are dwarfed. More often, however, the pathological lesion is malignant and death occurs before adulthood is reached. In macrosomia praecox there is essentially a disturbance of the "time" factor of growth and development, and the somatic and sexual changes of puberty are projected into early life. The transitory macrosomia must not be regarded as clinical evidence of a longitudinal growth stimulating effect from the sex hormones comparable to that of the anterior pituitary growth hormone for the changes are essentially those of maturity occurring prematurely.

As causes of macrogenitosomia three different types of pathological lesion have been described—tumours of the sex glands, tumours of the pineal and tumours of the adrenal cortex. In the first two groups the precocious development seems to be essentially a true and actual functional sexual precocity. In the female menstruation occurs at an early age and in the male priapism and spermatogenesis. Tumours of the sex glands have been reported in both sexes, but tumours of the pineal occur almost exclusively in males. Tumours of the adrenal cortex on the other hand, do not produce a true functional sex precocity (Krabbe, 1921; Grollman 1936) for, in spite of the skeletal, somatic, and sex changes suggestive of this menstruation does not occur in the female nor spermatogenesis in the male. The condition is usually referred to as the juvenile adreno-genital syndrome, and is more commonly found in female children, in whom signs of masculinization appear. In the male, when affected premature over masculinization develops.

In all three syndromes—genital, pineal, and adrenal—the outstanding features are skeletal somatic and sex development inappropriate to the age of the individual and suggestive of adulthood. Bone development is advanced correspondingly ossification centres appear early, and epiphyseal fusion occurs prematurely.

True Precocious Puberty Associated with Tumours of the Sex Glands

The syndrome of true precocious puberty in the female with the characteristic somatic and sexual changes of the sex is found with granulosa-cell tumours of the ovary as reported originally by Novak and Long (1933). These tumours develop from granulosa cell rests arising from the early oophorogenic structures in the sex gland area. They are more common in later life but when they develop during childhood true sexual precocity occurs. The granulosa cell is a typically feminine cell and produces the female sex hormone. Granulosa-cell tumours secrete large quantities of oestrogenic substance which is responsible for the sex changes and over accentuation of the female sex characters. In children menstruation has been observed as early as the first year together with such secondary sex characters as mammary hypertrophy, the growth of genital and axillary hair, increased growth the typical post pubertal feminine contour and increased size of the uterus almost to pubertal size. Novak and Long consider that the majority of these tumours are adenomatous and when malignancy occurs it is usually of a low grade.

In the male sexual precocity from testicular tumours is even more rare, at least, reports of only three cases verified at operation appear in the literature. Perhaps the best known is that of Sacchi (1895), a boy of 9½ years who presented macrosomia and sexual and mental precocity. After excision of a testicular tumour the precocity gradually disappeared. The tumour was reported upon as an alveolar carcinoma, but Cushing (1912) who commented on the case suggested an interstitial-cell origin. This boy was 4 ft 8½ in in height and weighed 7 st. A case similar to Sacchi's was reported by Rowlands and Nicholson (1929)—an interstitial-cell tumour, and Stewart, Bell and Roehle (1936) recorded a similar case in a boy of 5 years of age with precocious puberty—also an interstitial-cell tumour. The boy's height was 4 ft 3 in and weight 4 st 4 lb. The occurrence of such cases confirms the view that the interstitial cells of the testis secrete the hormone which influences the development of the secondary sex characteristics of the male and which in these cases brought about the premature growth and skeletal and muscular development.

The Pineal Syndrome

A similar syndrome of macrogenitosomia praecox, overgrowth and sex precocity has been reported in a number of instances in connexion with pineal tumours in boys, but whether the associated sexual and somatic changes are due to disturbed function of the pineal body is still quite undecided. There is, in fact, as yet, no satisfactory evidence or agreement as to an endocrine function in this organ. The chief theory advanced to account for the relation between pineal tumour and sex precocity assumes that normally a secretion from the pineal inhibits puberty and that, in the abnormal, destruction of the pineal allows the sex changes to appear. Horrax and Bailey (1925), summing up the position, thought that the best that could be said at the moment was that pineal tumours, particularly teratomata in male children before puberty, might be associated with precocious puberty such precocity, if combined with signs of increased intracranial tension and evidence suggesting implication of structures in the neighbourhood of the pineal body, was strong evidence of a pineal tumour. This did not mean that they regarded the pineal body as an endocrine gland with sex-controlling functions. Haldeman (1927) reviewed 113 cases reported as pineal tumours. In only ten was there convincing evidence that the tumour was a pinealoma. In sixteen only of the 113 cases was precocious puberty noted, and nine of these tumours were teratomata. Not one verified pinealoma was associated with the pineal syndrome of macrogenitosomia praecox. Then Horrax and Bailey (1928) reported a typical case of macrogenitosomia praecox associated with an astrocytoma in the third ventricle the pineal body not being involved by the growth. Ford and Guild (1937) reported three cases in which inflammatory processes involving the nervous system were followed by precocious sexual development and reviewing the whole subject of the pineal syndrome, concluded that the pineal tumours found in cases of macrogenitosomia praecox had only one feature in common—that they arose in the general region of the pineal body or extended into this region. They were of the opinion that the pineal body played no significant part in the production of macrogenitosomia praecox and that the syndrome though it was impossible to venture a definite opinion as to the exact location of the lesion was most probably due directly or indirectly to a destructive process in the walls of the third ventricle. This seems to be the

view most generally acceptable at the present time as regards the aetiology of the pineal syndrome. The clinical picture, apart from the neurological signs, is similar to that of macrogenitosomia praecox due to interstitial-celled testicular tumours.

The Juvenile Adreno-genital Syndrome

The adreno genital syndrome in children is predominantly an affection of the female, though it has been reported in boys. It is produced by tumours of the adrenal cortex either benign or malignant. It has been attributed to hyperfunction of the adrenal cortical cells with the elaboration of an excess of their specific hormone. Grollman (1936) however, points out that this is not in accord with available facts. The adrenal cortical hormone has not been shown to have any effects on the reproductive system analogous to those observed in the adreno-genital syndrome, nor are cortical adrenal tumours proper, adenomata and carcinomata, associated with changes in the sex glands. He therefore has suggested that it is only a specific type of cortical hyperplasia which is associated with such disorders of the reproductive system, actually a hyperplasia of the juxtamedullary or, as he prefers to describe it androgenic zone. This he considers is anatomically and functionally distinct from the rest of the cortex and normally only of temporary existence disappearing in the first year of life. Grollman's thesis requires further proof, but he has brought forward evidence and pointed out that it is in accord with the known facts and permits a logical explanation of adreno-genital relationships which are otherwise inexplicable. In this connexion it should be mentioned that Broster and Vines (1933) working histologically on adrenals removed from cases of the adreno-genital syndrome, have found that the juxtamedullary tissue takes up a special fuchsinophil stain which differentiates it from normal cortical tissue.

The characteristic features of the juvenile adreno genital syndrome in young girls are overgrowth and the premature appearance of secondary sex characteristics of the male type, hypertrichosis hypertrophy of the labia, and enlargement of the clitoris, but menstruation does not occur. In male children there is overgrowth with hypertrichosis and enlargement of the external genitalia, but the testes remain immature and do not show spermatogenesis. In both sexes the patients acquire an adult appearance, and owing to their pronounced muscular development have been referred to as the infant Hercules' type. Bone development is much advanced for age ossification centres appear early and epiphyseal fusion takes place prematurely. Arrhenoblastomas of the ovary as has been reported by Novak and Long (1933) produce an almost identical condition. The masculinizing tendencies of these tumours are believed to be due to their origin from undifferentiated cells in the rete ovarii, the female homologue of the testis.

The special features of the group of conditions included under the general heading of macrosomia praecox may be summarized as follows. The essential abnormality is a disturbance of the time factor of growth and development, and changes which should occur in adolescence are projected into earlier life. An impression of overgrowth and overdevelopment is thus created, but it is only relative to the age of the individual. Premature senescent changes in the growth cartilages result in early fusion of the epiphyses and early cessation of growth. The general bodily skeletal and sex changes may be attributed to the action of the sex glands and their hormones either

primarily or secondarily involved. The sex changes represent a true precocity, in the case of the sex-gland tumours but a pseudo precocity only in the juvenile adreno genital syndrome. The growth curve in macrogenitosomia praecox is unduly precipitate in comparison with the normal, and the short-limbed, disproportioned skeleton which is found is due to premature fusion of the long bone epiphyses before the active limb lengthening and 'springing up' period of the second dentition.

AURICULAR FLUTTER CONTINUING FOR TWENTY-FOUR YEARS

BY

SIR THOMAS LEWIS, M.D., F.R.C.P., F.R.S.

Physician University College Hospital

In May, 1912, I saw a clergyman aged 53 who related that he had suffered from paroxysms of tachycardia since his boyhood, and that three years before I saw him his pulse had become persistently rapid, varying only between 140 and 160 beats per minute. He was under my observation for a month, during which I took many electrocardiograms from him. These showed auricular flutter, the auricular rate being usually between 280 and 300 occasionally falling a little lower or rising a little higher. Except while under digitalis, the ventricular was always half the auricular rate. Slowing could only be obtained by digitalis if the patient was nauseated, and by strophanthus only if the patient suffered purgation, both forms of drug treatment were consequently abandoned.

It is to be noted that the rates obtained electrocardiographically strikingly confirmed the patient's own statement of rates, he was an intelligent man and unusually accurate in observation. His case was reported in *Heart* 1912 4 179 (Case 3), and his curves are illustrated by Fig 28 of that paper (see Fig 1). He was anxious about

alert and vigorous for his age, presenting no other signs of heart affection but the old standing tachycardia. His auricles were still fluttering, though the rate in the curves was 210 to 214, the ventricles responding at half this rate (Fig 2). This change of rate and prolongation of

Fig 2

the initial phases of his ventricular curve were the only notable features of the electrocardiogram.

He writes in 1937 to say that his condition is unchanged and his health satisfactory.

Commentary

The case is of exceptional interest for three reasons. First, the auricles seem to have fluttered without cessation for twenty four (if not twenty seven) years. Secondly, although the ventricle during the greater part of this period has been driven at very excessive rates, the efficiency of the heart has not been impaired by its increased energy expenditure. Thirdly, the rate of auricular beating has fallen about 80 beats per minute. This fall might be attributed to lengthening of the circular path around which the wave travels, or more probably to its slower speed of movement. It would be interesting to know if lowering of rate is usual in auricular flutter as age greatly advances.

Fig 1

himself and suffered easily from fatigue but no signs of cardiac affection other than that of flutter could be found in him.

A few years after I first saw him he retired from work in a very busy parish but continued in lighter posts until shortly before he visited me in June 1933 when he was in his seventy fourth year. He then told me that his heart had continued to beat rapidly and regularly during the intervening twenty-one years but that he had enjoyed very fair health though unable to walk more than a mile without undue fatigue. He said that his heart still beat rapidly though not so rapidly as formerly the rhythm being usually 94 to 102 and regular. I found him very

P Duval and J-Ch Roux (*Presse méd* March 6 1937, p 353) draw attention to the different reactions of individuals to similar surgical interventions. The incessant breaking down and reconstruction of tissue frees certain toxic albuminoids in the blood and it is suggested that the varying degrees of susceptibility to the products of disintegration may account for the variations in resistance shown by certain individuals to different crises. This variability is particularly noticeable following surgical treatment or burns when such intoxication takes place. Two patients may undergo identical operations under exactly similar conditions, but whereas one will suffer a severe post operative reaction the other will show no such symptoms or signs. It is suggested that the reason for this is the autogenous susceptibility of the first patient and the lack of susceptibility in the second. It is also known that the reaction which follows a second operation is usually more severe than that which followed the first showing that the original operation brought about a condition of increased susceptibility in the patient. The same variability is noted in two similar cases of burns of equal severity: one patient died after four days from severe intoxication while the other survived this period of intoxication and only succumbed on the twelfth day to infection. Analysis showed that the biological reactions were much stronger in the first case than in the second. Similar conditions are seen in other lesions such as cerebral haemorrhage, haemorrhagic thorax or jaundice.

HYPO-ADRENALISM AND PELLAGRA

THE ROLE OF VITAMIN DEFICIENCY

BY

I M SCLARE, L.R.C.P. & S.E.D.

Junior Assistant Medical Superintendent (Observation Wards)
Stobhill Hospital Glasgow

Pellagra is commonly regarded as a disease due to deficiency of vitamin B, and the impression prevails that, confronted with this illness, we need merely add yeast to the patient's diet in order to effect a cure. That vitamin deficiency plays a very important part is indisputable, in this paper, however, it is suggested that B avitaminosis is not the sole causative factor. Moreover, Parfitt (1936) recently reported that after large doses of yeast a patient suffering from pellagra improved dramatically, only to collapse suddenly and die some days later. Pellagrous dermatitis may clear up after vitamin B₂ has been given but it seems clear that vitamin C may be equally effective (*vide infra*). Again, Biggam and Ghalioungui (1933) reported considerable success with massive doses of iron in an extensive series of cases of pellagra. In a child of 8 years whom I have at present under my care, a dermatitis coming on after exposure to strong sunlight, and very suggestive of pellagra, has cleared up more than once after vitamin B, but the patient's general condition mental and physical, is steadily deteriorating. It ought therefore to be realized, as Muir (1936) says that further investigation is necessary before we can pronounce as to the relation of vitamin B, to pellagra.

Leaving for the present the problem of the exact association of vitamins with pellagra, the undernoted case history is submitted. This shows once again what has been brought forward from time to time during the past thirty five years, that there exists a close connexion between pellagra and suprarenal hypofunction, and the purpose of this paper is to suggest that the fundamental aetiological factor in pellagra is hypo-adrenalism, avitaminosis acting only as an accessory cause.

Illustrative Case

The patient was a woman of 45 happily married and comfortably off. She had two sons 18 and 15 years of age. Her husband and children were in good health. She was born in Scotland and both her parents were of pure Scottish extraction. On December 5 1935 she was admitted to hospital complaining of weakness, lassitude, anxiety, nervousness, insomnia, anorexia, constipation, abdominal pain and discomfort, all of six months duration. She was however well nourished and had been taking a good mixed diet. Her height was 5 ft 3 in and her weight 9 st. 3 lb. Investigation failed to disclose any gross physical abnormality; the blood Wassermann reaction was negative.

The tentative diagnosis was one of hypochondriasis, with however this important reservation—that there might be present some undefinable endocrine disorder. The reasons for this reservation were as follows: (1) The patient had a history of hyperthyroidism in 1928 from which illness she was supposed to have made a good recovery under medical treatment. (2) Her appearance suggested a peculiar compound of hyperthyroidism and hypothyroidism. (3) She was distinctly Italian looking, her skin exhibiting a generalized amber pigmentation and her hair being very dark and of silky texture. Suprarenal hypofunction as a possible cause of her illness was considered. Nevertheless as her blood pressure was normal and as at times she jugged herself out of her ideas of weakness and lassitude especially when she had visitors at her bedside and as x-ray examination revealed no suggestive shadows either in the chest or in the suprarenal areas no confirmatory evidence could then be obtained.

On December 28 twenty-three days after admission she was allowed to go home. She had taken a well balanced diet there had been no evidence of gastro intestinal upset and aided by an occasional grain of luminal she had slept quite well. She was improved in bodily and mental health.

Two months later she had so far relapsed that she was referred back to hospital from the Public Health Department Out patient Psychiatric Clinic. Readmitted on March 5 1936 she again complained of abdominal and anxiety symptoms. Noteworthy points on physical investigation were: blood pressure 130/80 pulse 85, menstruation which had been absent for fifteen months until November 1935 was now regular but diminishing in quantity, exophthalmos was present, the face was puffy and the whites of the eyes pearly, the ocular fundi were normal, the skin of the forearms and hands was rough and very cold to the touch, a fractional test meal showed achlorhydria, the deep reflexes were exaggerated, there was a fine tremor of the hands, radiographs of the chest were negative and of the abdomen showed visceroptosis. Two points should be specially noted: (1) with regard to pigmentation, a slight deepening of the generalized amber colour had occurred, (2) the body weight had fallen to 7 st. 10 lb., a loss of 21 lb in about ten weeks. Mentally an element of depression had moved well into the foreground but there was no retardation and memory orientation, and perception were normal.

On April 25, 1936 the patient developed an acute tonsillitis (*Streptococcus viridans*) this completely cleared up within a fortnight with subsequent substantial mental and physical improvement. On June 16 she complained of headache and insomnia which persisted for over a week. On July 11 she developed marked diarrhoea which proved extremely difficult to overcome. Bacteriological examination of stools revealed no abnormality. About the middle of August a marked change took place in her mental condition, she became exceedingly dull and depressed. She presented the picture of an acute agitated melancholia and the power of ideation previously always well developed now became notably deficient. She then began to waste, and her weight quickly fell to 6 st 6 lb. She felt very weak. A deep-brownish pigmentation appeared symmetrically on the dorsum of the hand and wrist and a few spots on the neck. The blood pressure fell down to 90 mm Hg systolic and diarrhoea returned. A diagnosis of Addison's disease was made and vigorous treatment was started by the excess sodium chloride method including large doses of intravenous saline daily. Suprarenal and mixed gland extracts—desiccated suprarenal gland adrenal substance Parke Davis and Co. and mixed gland (female) tablets Evans Sons Lescher and Webb two tablets of each three times daily—were also given and generally all stimulating measures were adopted. Her appetite was poor but care was taken to see that she received a full, well balanced diet with plenty of vitamins. She showed immediate response to these efforts within five days her systolic blood pressure had gone up to 105 mm Hg, and by the end of August to 110/65 mm Hg. Her weight however continued to fall. Small doses of insulin were given but she complained of great nausea after the injections. Intensive salt and glandular treatment was continued until September 7. She persistently complained of abdominal discomfort, and diarrhoea proved very intractable. Stools were negative for occult blood and bacteriological examination revealed nothing of importance but examination on October 20 showed great increase of streptococcal content, with the presence of *B. pyocyaneus*. This is a frequent terminal finding in debilitated mental patients and is of no particular significance.

At the beginning of November it having been observed that Demole (1936) had made out a good case for vitamin C as an augmentor of suprarenal cortical function, a copious quantity of lemon juice was added to the diet. The result was striking almost at once the pigmentation on the backs of the hands began to clear. But the patient was wasting fast, her weight was now only 5 st. 12 lb. and the blood pressure 105 mm Hg. Meantime Dr Stewart the visiting psychiatrist had pointed out that the pigmentary changes of the hands suggested pellagra, and on November 17 Dr McLachlan the dermatologist

logist confirmed this diagnosis on the following grounds (1) atrophy of skin on back of hands and on the lower half of the face (2) distribution of the excess of cutaneous pigment, (3) presence of gastro-enteritis and of mental symptoms (4) history of attacks of redness of skin of face and hands. The patient had become difficult to feed, but nevertheless was still getting a good general diet. She complained of tingling and crampy pains on the soles of both feet and a feeling of great weakness. By November 20 her blood pressure had fallen to 90 mm Hg. Blood examination showed a secondary anaemia. Mentally she was less agitated. On November 23 without any warning she had a rigor and was afterwards in a state of semi-collapse. Recovering from this, she presented for the first time a state of acute confusional insanity. She was utterly incapable of apprehending the nature of her surroundings. She suffered from visual and auditory hallucinations, and showed extreme motor restlessness. Her blood pressure had fallen to 68 mm Hg. and there was a coarse tremor of hands and feet. On November 24 the blood pressure fell to 48 mm Hg. and death was ushered in with delirium and urgent dyspnoea.

The post mortem examination was conducted by Dr Marjorie Gillespie to whom I am indebted for the following relevant notes. The heart was small, the stomach and intestines showed patchy congestion of the wall, the condition being most marked in the caecum and ascending colon; microscopically the thyroid gland showed hyperplasia passing into hypoplasia, no gross lesion was present in the suprarenal glands. Microscopical examination of the skin by Dr McLachlan revealed marked hyperkeratosis, excess pigment present in superficial layer of epidermis, slight irregularity and elongation of the rete cones, no atrophy in the sections examined. Collagen fibres in the subepithelial layer had undergone a small degree of hyaline change, some of the papillae showed a certain amount of oedema. No changes of pathological importance were found in the conum. A very slight infiltration of the pars papillaris had occurred. Examination of the skin coincided with the clinical observation that pigmentation was disappearing after giving vitamin C.

Discussion

The first question arising in the present case is whether the diagnosis of Addison's disease was correct or whether the patient suffered primarily from pellagra. That no lesions were found in the suprarenal glands is of no help in arriving at an answer. Disease is a process concerned with living cells, and functional derangement is not necessarily associated with anatomical changes of so gross a character that they are demonstrable even with the aid of the microscope. Especially is this the case when the diseased tissue is obtained at post mortem examination of the human subject.

Another difficulty arises from the fact that textbook descriptions of the syndromes of suprarenal dysfunction and pellagra show a striking correspondence. In both we find very similar alimentary, nervous and integumentary symptoms. In the present case, however, whether the true diagnosis was Addison's disease or pellagra, certain features tend to place the primary disorder at the door of the suprarenals—namely (1) Hypotension becoming gradually worse (2) Favourable response to suprarenal therapy (3) Previous history of endocrine disorder (4) Generalized pigmentation present for many years before she came under care (5) The patient's age and disorder of menstruation (6) Her death was in the nature of an acute collapse and this has often been associated with adrenal failure. One need only mention such conditions as toxic diphtheria, malarial collapse and surgical shock (7) The histological appearances of the thyroid gland were those associated with hypothyroidism following upon hyperthyroidism. It is suggested that long standing cortical adrenal hypofunction

may have caused, first, a relatively overacting thyroid ("The cortex is the very antagonist of the thyroid—Goldzieher, 1929), with a final adreno thyroid exhaustion.

Furthermore it is interesting to note that although the patient finally developed pellagra, (i) there was no dietetic (either protein or vitamin) deficiency of intake, (ii) on the same diet as the forty other patients in the ward she was the only one to acquire the disease, (iii) being a bed patient she was not more exposed to the sun or other trauma than any of the others, (iv) no infective condition was present. Here, therefore, is a case of hypo adrenalism terminating in "pellagra" with no factor either of deficient nutritional intake or of infection to account for such a development.

Even if this adrenal-pellagra combination had never been previously noted, the case here described would have been of interest because of the uncertainty surrounding the aetiology of pellagra. Since, however, so many observers have called attention to this phenomenon there is evidently here a fruitful field for exploration.

RELATION BETWEEN ADDISON'S DISEASE AND PELLAGRA

Simpson (1935), when describing two cases of secondary pellagra, called attention to the connexion between Addison's disease and pellagra, and concluded that a definite relation exists. He also quoted from Harris (1919) eight cases of Addison's disease reported by Finotti and Tedeschi (1902) which had terminated as pellagra and which had shown severe post mortem adrenal changes, as well as other cases since that time which showed pellagra supervening upon Addison's disease. Parfitt (1936) does not mention the association between Addison's disease and pellagra, but the two cases described by him as pellagra could also be described as typical clinical examples of hypo-adrenalism, and Watson (1922) commenting on fourteen cases diagnosed as pellagra at Rainhill Asylum, made the following significant observations: (1) The age grouping was between 40 and 50 years, (2) the course of the disease measured only in weeks (except in the two youngest of the series), (3) the diet of the patients had been more varied and more generous than usual.

Examining more closely this association between the symptoms of hypo adrenalism and pellagra, it will at once be conceded that no substantial difference exists either in the alimentary or pigmentary phenomena (Rowntree, 1925, Goldzieher, 1929a, 1929b). Hypotension, however, demands careful scrutiny. Here we appear to be confronted with an exclusively Addisonian sign yet a careful search through the literature reveals that the question of blood pressure in pellagra is scarcely ever mentioned. Stannus and Gibson (1934) reviewed all the cases diagnosed as pellagra in Britain up to 1934 but no reference is made to blood pressure. Parfitt (1936) and Simpson (1935) each describe two cases in which the blood pressure was low. It is at least open to question whether in pellagra the arterial tension could possibly be maintained at a normal level in face of the array of debilitating symptoms. At post mortem examination the heart in pellagra is found to be small, just as it is in Addison's disease. Is it not probable that in the combination of low metabolism and diarrhoea (both common to Addison's disease and pellagra) there lies the common explanation of diminished tension and small size of heart?

SEX INCIDENCE

Combined figures of sex incidence in Addison's disease and pellagra show a preponderance of females over males. If, as seems at least suggestive, suprarenal hypofunction

is the common antecedent of both clinical syndromes, this is what one would expect, since fundamental glandular weaknesses are more likely to be exposed in females. Hutton and Steinberg (1936), commenting upon 176 clinic patients suffering from definite endocrinopathy, give the sex incidence as 146 female and thirty male. Stannus and Gibson (1934) give the sex incidence of 131 British cases diagnosed as pellagra from 1912 to 1931 as 111 female and twenty male—a remarkable similarity in ratio. It is difficult to imagine such a gross sex disparity arising entirely from a difference in vitamin intake. Assuming, however, a sex equality of vitamin intake and absorption, women might conceivably suffer more readily than men if certain vitamins were found to be essential elements in the maintenance of suprarenal and other endocrine functioning. Average vitamin absorption might then prove relatively insufficient because of increased endocrine demands, particularly at times of physiological stress. The large proportion of female cases of so-called pellagra occurring at the menopause is significant. In other words, one of perhaps many factors which bring to light endocrine discord and precipitate an apparent unilateral endocrinopathy may well be insufficient intake or absorption of certain vitamins, and especially so at the climacteric. Again, what appears to be a disease purely of vitamin insufficiency may, moreover, be the expression of a latent endocrine abnormality. Does any evidence exist of such an association as is here implied between vitamins and the suprarenal glands? The undemoted observations regarding vitamin C are of interest.

(i) The suprarenals are known to be particularly rich in ascorbic acid. (ii) Demole (1936) employing the test for vitamin C subnutrition devised by Harris and Ray (1935) found that the body of the Addisonian patient is impoverished of vitamin C. (iii) Wilkinson and Ashford (1936) describe three patients suffering from Addison's disease all showing vitamin C subnutrition the degree of subnutrition paralleling the severity of the illness. (iv) Demole (*loc cit*) quoted the following additional points of interest: (a) Striking demonstrations by Thaddeus have proved that resistance to experimental infection in adrenalectomized animals requires vitamin C as well as cortin. Thaddeus concludes that if vitamin C does not augment production of cortin its presence is useful for the proper functioning of the suprarenal cortex, probably acting as a powerful augmentor of the action of cortin. (b) Szent-Györgyi has shown that vitamin C diminishes Addisonian pigmentation and (c) to several Continental preparations of suprarenal extract ascorbic acid is now added. (v) Many observers have recorded diminution of pathological pigmentation with lemon juice and the case described in this paper is yet another example. (vi) Lockwood and Hartman (1933) mention delay of onset of symptoms of B and C avitaminosis with injections of suprarenal cortical extract.

Although much work remains to be done to establish the precise relations between vitamin C and the suprarenals the existence of some synergistic association is probable.

SECONDARY PELLAGRA

Since 1916 it has been maintained that there exists a separate clinical entity known as secondary pellagra. This has been defined by Simpson (1935) as "pellagra occurring secondary to an initial gastro-intestinal lesion or disorder the causation of which is entirely unconnected with pellagra." It is suggested that the grounds for this clinical distinction are inadequate. One may as well describe an Addisonian patient first seen with gastro-intestinal symptoms as a secondary Addison.

If it were proved that pellagra is merely a manifestation of hypo-adrenalism and if the need of the suprarenals for

adequate vitamin stimulation were established, a simple explanation would then suffice for the essential nature of both primary and secondary pellagra—namely, that the gastro-intestinal disorder prohibits adequate absorption of the vitamins requisite for suprarenal functioning. Such a thesis is supported by the fact that achlorhydria occurs both in hypo-adrenalism and in pellagra. Thus the aetiology as well as the symptomatology of functional hypo-adrenalism and pellagra could be brought under a common heading. In other words, the cause of pellagra could be described as hypo-adrenalism precipitated by avitaminosis.

It is hoped that the points raised in this paper may result in a closer scrutiny of all suspected cases with a view to furthering the knowledge of the hypo-adrenal-pellagra association. Certainly in cases of so-called pellagra there should be a routine investigation made of the blood pressure of the gastric juice, of the ascorbic acid excretion, and of the endocrine as well as of the dietetic factors.

Treatment

Until the question of hypo-adrenal-pellagra relations is definitely determined the suggestion is advanced that treatment of the patient should be directed on the following lines: (1) *Diet* should be generous and varied. (2) *Vitamin therapy*. Large doses of vitamins A, B, C, and D should be included in the diet. Lemon juice, egg-white and cod liver oil daily will probably cover all requirements. (3) *Cortin*. A commencing dose of 10 c.c. suprarenal cortical extract, intramuscularly, daily until the condition is stabilized. (4) *Sodium chloride*. 15 grammes a day intravenously and excess salt in the diet. (5) *Acid HCl and pepsin* with all meals. (6) *Pil. Blaud*. (7) *Adrenaline*. Small subcutaneous doses frequently until stabilization.

Summary

1. The specific value of vitamin B₂ in pellagra is called in question.
2. A case is described showing "pellagra" as a terminal manifestation of hypo-adrenalism.
3. Attention is called to a probable relation existing between vitamin C and the suprarenal cortex.
4. Many of the features characteristic of functional hypo-adrenalism, pellagra, and secondary pellagra strongly indicate that these conditions have aetiological factors in common.
5. It is suggested that two essential points in the aetiology of pellagra are (a) primary hypo-adrenalism and (b) inadequate vitamin augmentation of adrenal functioning.

I wish to thank Dr. William Martin, medical superintendent for permission to publish the notes of this case.

EPITHELIAL OVERGROWTHS AND DIVERTICULA IN THE GUT OF RATS FED ON A HUMAN DIET

BY

D M LUBBOCK, B A Camb

W THOMSON

The Rowett Research Institute Aberdeen

AND

R C GARRY, M B, D Sc, Glas

*Professor of Physiology University College Dundee
The University of St Andrews*

Although diverticulosis and diverticulitis are by no means rare conditions in human pathology, yet the aetiology is far from clear. Probably no one factor is responsible for all cases. Thus the occurrence of diverticula in rats fed on a human diet seemed to warrant systematic investigation in the hope that the findings might be not without bearing on the pathological process in man.

A long-term experiment with rats on a human dietary was begun at the Rowett Institute in December, 1932, and was described in 1935 (Orr Thomson, and

Fig 1—Gut of rat affected with epithelial overgrowths.
S = Stomach C = Colon

Garry). In this experiment two groups of Lister hooded rats bred from the same stock have been reared for six generations under exactly similar environmental conditions except for diet. One group received a ration closely approximating to that eaten by a working-class community in Scotland as ascertained by a dietary survey (Davidson, *et al* 1933); this will be referred to as the 'experimental group'. The other group known as the 'supplemented group' received the same diet with an additional supply of milk and green food.

During the course of the experiment a spontaneous epidemic with an organism of the *Salmonella* class broke out in the colony and caused a high death rate from gastro-enteritis especially in the experimental group. During routine post-mortem examinations it was found that many animals showed nodular swellings or thickenings in the distal part of the small intestine and in the proximal and intermediate colon. These were found only in animals over 100 days old—that is, in adult animals

Macroscopic Appearance

In the small intestine the lesions were mostly in the distal ileum on the anti-mesenteric border. The size varied probably according to the age of the lesion, from that of a small pin head to that of a cherry, and was thus sometimes three or four times the diameter of the gut. In cases of long standing the large number of individual nodules gave the gut the appearance of a string of beads (Fig 1). In the large intestine the wall of the proximal and intermediate colon was usually thickened to form a stiff hard mass often studded with small sessile nodules. The distal part of the colon, the rectum, was free from such lesions. In the advanced stages there were adhesions to the omentum and to adjacent loops of bowel. On incision both small and large bowel lesions were found to have large loculi, in many instances filled with pus, and the growth often encroached on the gut lumen, reducing it to a small channel. Sometimes it was possible to see a small opening communicating between the loculi and the gut lumen. Thus there was a striking resemblance to the condition observed in man, both with respect to the macroscopic appearances and to the sites of the lesions.

Microscopical Appearance

Histologically the lesions were essentially the same in the small and in the large guts. The chief characteristic was extreme glandular proliferation with penetration of the muscular coats, in some cases this proliferation extended into the adherent omentum. In the majority an inflammatory reaction was present and there was often profuse round cell infiltration. In the later stages there was abscess formation. In certain regions caseation occurred, not

Fig 2—Transverse section through a nodule in the ileum.
GL = Gut lumen D = Diverticulum

unlike that seen in tuberculous foci. Attempt at repair could be seen, as instanced by the presence of fibrous tissue.

Fig 2 illustrates a transverse section through the middle of a lesion in the ileum showing direct communication with the gut lumen and consequent formation of a diverticulum. Fig 3 represents a section of the colon in the same rat showing extreme glandular proliferation on one side of the lumen and a sessile nodule under the serous coat. Fig 4 illustrates in one of the largest nodules the characteristic microscopical appearance: the epithelium retained its normal structure there was no satisfactory evidence of penetration of the basement membrane and in no case were metastases found. There was then no evidence for malignancy in the stages at which the lesions were examined.

Probably the natural history of a nodule is as follows. For some unknown reason the glandular epithelium proliferates and penetrates the muscular coats, tending all the

time to retain its acinous form the acini are prone to infection, and inflammation follows often with necrosis

A condition of somewhat similar nature was described by Leitch in 1924. He put such foreign bodies as human gall stones, pebbles and pitch pellets into the gall-bladder of guinea-pigs. As a result there was destruction of the lining membrane of the gall bladder and then repair by an epithelium which in the majority of cases proliferated to such an extent that it penetrated and destroyed the wall of the gall-bladder. Nevertheless the acinous arrangement of the epithelium persisted, and cytologically

FIG. 3.—Transverse section through a lesion in the colon. A points to subserous nodule.

FIG. 4.—Section through a nodule. Note the dilated acini and round-cell infiltration.

there was no real evidence for malignancy. But, since these epithelial overgrowths invaded neighbouring organs such as the liver or penetrated tissue adherent to the gall bladder Leitch reported that the process was malignant. However in 1933 Burrows repeated and confirmed Leitch's results but definitely decided that the condition induced was not malignant in the true sense of the word. The microscopical appearances illustrated by these two workers are remarkably like those described here.

Incidence of Lesions

The gut lesions were first noted in the winter of 1933-4 when the experiment had been running for about one year. Since then until the end of the experiment this year a number of rats have continuously been found to be affected. Of seventy-six animals in which either the small or the large bowel or both were concerned fifty-four were

fed on the experimental diet and twenty-two on the supplemented diet. In those on the defective diet the lesions were usually more extensive. The number of rats with gut lesions in each generation on the experimental and supplemented diets have been compared with the total number of rats in each generation living beyond a hundred days, the age above which lesions have been observed. This is shown in the table.

Generation	Experimental Diet			Supplemented Diet		
	Number with lesions	Number surviving 100 days	Incidence	Number with lesions	Number surviving 100 days	Incidence
Parental	2	29	6.9	2	30	6.7
F1	14	234	6.0	3	205	1.5
F2	29	129	22.5	1	94	1.1
F3	7	53	13.2	8	107	7.5
F4	2	12	16.7	8	112	7.1
General Incidence	54	457	11.8	22	548	4.0

Since the environmental conditions of the two groups were identical apart from diet and these were bred from the same stock, this higher incidence would seem at least to indicate that the nutritional level of the diet is one factor in the aetiology. No more than this can be said at present. The original dietary experiment in which this outbreak occurred has now been concluded. Further similar dietary experiments, however, are being continued, and the rats in these experiments will be examined for these nodules.

It seems then that we have in these rats a pathological process which macroscopically has all the appearances of diverticulosis and diverticulitis in man. Microscopically apart from the inflammatory processes common to both the resemblance ceases. However, since the aetiology of diverticulitis in man is obscure, since relatively little work has been done on the histopathology of this condition in man, and since the lesions here described have appeared in rats especially in elderly rats and in rats on a human diet known to be far from perfect it does seem worth while putting this condition on record in the hope that it may stimulate interest in the essential pathological processes of diverticulosis and diverticulitis in man. Moreover we have been unable to find any reference in the literature to this condition in rats.

Summary

In rats fed on a low grade human diet an unusual kind of epithelial proliferation was observed in the small and large guts. This resulted in multiple diverticula, which penetrated the entire thickness of the bowel wall. Macroscopically there was a striking resemblance to diverticulitis as seen in man but microscopically we were forced to regard this change as an acquired heterotopia. Throughout the period of observation no evidence for malignancy was detected.

The authors are deeply indebted to Professor D. F. Cappell, University of St. Andrews, for advice in interpretation of the pathological changes and to Dr. J. T. Irving Rowell Institute for assistance in presenting the data.

HYPOGLYCAEMIC THERAPY IN THE
PSYCHOSES

BY

HUNTER GILLIES, M B, Ch B Glas, D P M

*Assistant Medical Officer West Ham Mental Hospital,
Clinical Assistant West End Hospital for Nervous
Diseases W I Psychiatric Clinical Assistant
Prince of Wales's Hospital N 15*

In 1935 Manfred Sakel of Vienna published a book describing his new insulin shock treatment of schizophrenia. Since then his method has been used in many parts of the world, and in this country reports have been published by Russell (1937), Larkin (1937), and James and co-workers (1937). Up to now I have administered this therapy to sixteen female psychotics, the majority of whom were cases of schizophrenia. Two of these cases are described later, as they present features that have not been fully recorded in the English literature. The first case showed status epilepticus in the course of treatment, and the other laryngeal spasm on two occasions. It happens that in the first case the series of convulsions was apparently responsible for a remarkable improvement in the mental condition, but it would be premature to draw conclusions from this, and my purpose is rather to point out certain of the dangers associated with this treatment. A complication which demands no description is the lessened resistance to infection that is sometimes seen in these patients. In my series there have been two cases of pyelitis, which quickly responded to mandelic acid.

Details of the technique will not be given here as they have been well presented in the recent article by James and his co-workers. Essentially the treatment consists in the daily injection of increasing amounts of insulin, until a dose is reached which causes hypoglycaemic coma. On succeeding days this dose is maintained until mental improvement occurs or there is a lack of response to the treatment. In practice, however, few patients receive the routine treatment. The variations are mainly concerned with the criteria for interruption of the hypoglycaemia, and constitute the most difficult part of the technique.

Case I

A woman aged 32 years was admitted as a temporary patient on May 28 1935 with a history of mental disorder of three weeks duration. She was in a state of acute confusion being completely disorientated and was restless, insomniac, resistive and impulsive, and had aural hallucinations. It was stated that she had suddenly developed this condition on the night of May 5. After about four weeks in hospital she showed some clearing of consciousness. However a silly fatuous element was then noticed in her speech and appearance. She began to have grotesque delusions of little depth and of a grandiose nature and the affective reaction was observed to be shallow and did not co-ordinate with her expressed thoughts. A diagnosis of paranoid schizophrenia was made. On May 7 1936 she was certified after two extensions of her temporary status.

The hypoglycaemic treatment was begun on February 13 1937 with the intramuscular injection of 24 units of insulin. The insulin used was Messrs. Boots quadruple strength—that is 80 units per c.c.m. The dose was increased by 8 units daily until on February 18 with 64 units she became comatose. This dose was continued daily except on Sundays until February 23 when she developed status epilepticus. At 7.25 a.m. on that day she had received 64 units of insulin. At 9 o'clock she was drowsy and at 9.15 a.s.c.s appeared on the face and chest. At 10.20 she became comatose and an oesophageal tube was passed by the nasal route. Further progress in the coma was uneventful and as usual her degree

of unconsciousness was light—that is, she was insensible to painful stimuli the conjunctival reflex was absent the corneal reflex on both sides and the knee and ankle reflexes could just be elicited, while the plantar responses were bilaterally extensor. She was fed at 12.10 p.m. with 150 grammes of glucose in half a pint of water and had regained normal consciousness by 12.35. At 12.40 she had a typical major epileptic fit with well marked tonic and clonic stages. By 12.44 she had recovered full consciousness and appeared none the worse. At 12.50 a second major convulsion occurred. From this she recovered in four minutes, and as she appeared well no intravenous glucose was given. She was occupied until 3.10 when she had a third major fit from which she did not regain consciousness. Identical convulsions occurred at twenty minute intervals until 5.40 making a total of ten convulsions that day. Treatment was as follows:

3.15 p.m.—30 c.c.m. of 25 per cent. glucose in saline given intravenously.

3.20 p.m.—Glucose 5 ounces, calcium lactate 20 grains, and prominal 1 grain in half a pint of water given per oesophageal tube.

3.40 p.m.—Soap and water enema given with fairly good result.

3.50 p.m.—Adrenaline 1/2 c.c.m. injected subcutaneously.

4.15 p.m.—Stomach washed out with normal saline solution and ammonium chloride 40 grains left in the stomach.

4.20 p.m.—Lumbar puncture was performed and 20 c.c.m. of cerebro-spinal fluid removed. It was under greatly increased pressure.

5.20 p.m.—1 c.c.m. of 20 per cent. luminal solution injected intramuscularly.

6.20 p.m.—Lumbar puncture was repeated and 20 c.c.m. of fluid removed. The pressure was less this time, although still raised.

There were no further fits after 5.40 p.m. and at 9 p.m. the coma lightened and she became restless. At that time morphine sulphate 1/4 grain was injected subcutaneously. At no period during the day did the cardiac condition give anxiety. The need for constant medical attention during the hypoglycaemic treatment is shown by the fact that her bedside was hardly quitted the whole of that day.

All the next day the patient was drowsy but on the morning of February 25 she was found to be pleasant and coherent in speech. As recovery might be hindered by a psychological investigation no questions were put to her but from her spontaneous utterances it was obvious that she had lost her psychotic signs and symptoms. She was no longer deluded or hallucinated and was coherent, relevant, rational and pleasant in conversation. In her affective conative and cognitive responses she appeared normal. On April 5 she was discharged on trial. On the 26th she reported back and appeared so well that she was discharged altogether.

On June 9 she reported again for a more complete mental investigation and showed entire disappearance of schizophrenic symptoms with normal affective relationship and ability to return to her normal sphere of work. It was felt however that she did not fully appreciate the serious nature of her illness and so her case had best be recorded as an incomplete remission according to the standards of Müller (1936).

Discussion

Typical major epileptic fits are common in this treatment and other convulsions may occur that show a preponderance of tonic or clonic stages but are still to be looked on as major epileptic fits. These fits may appear at any stage in the hypoglycaemia even when this has apparently been relieved by glucose. The latter occurrence may be due to the hydration of an already irritable cortex.

The epileptic fit is not now regarded as a catastrophe and it does not depend on the blood sugar level. It is of interest that Meduna (1936) by the use of various con-

vulsive agents, especially camphor and metrazol (cardiazol) has claimed to have had good results in the treatment of schizophrenia. He believes that the likelihood of cure with his treatment is proportional to the liability to convulsions. It is reasonable to suppose that in the case described above a similar therapeutic result would have been achieved by the use of cardiazol, and my experience in the use of this drug shows that it is simpler and safer than the hypoglycaemic treatment.*

For status epilepticus the treatment is the administration of glucose intravenously and by the oesophageal tube, along with repeated lumbar puncture. A soap and-water enema and the injection of 1/4 grain of morphine may also be indicated.

It may be added that in the case described the personal and family histories contained no reference to epilepsy or other nervous or mental disease. It was the patient's first psychotic attack, there were no apparent exciting factors, and there had been no evidence of remissions during her stay in hospital. It remains to be seen how long the present mental improvement will last.

Case II

A woman aged 27 years was admitted as a temporary patient on March 5 1935, and was certified on March 10, 1936. Throughout her stay she has shown mutism and apathy, but without katatonic features; hence benign stupor appeared to be the most appropriate diagnosis.

Hypoglycaemic treatment was begun on April 7 1937, with a dose of 24 units of insulin. By April 23 she was having 104 units, and on that day three hours after the injection and while still awake she suddenly showed inspiratory stridor and at once became cyanosed and unconscious. The pulse was 40 beats per minute and was intermittent. She was immediately given 1 ccm of coramine intramuscularly, 1 ccm of adrenaline intramuscularly and 5 ccm of 25 per cent. glucose in saline intravenously. By this time she had stopped breathing, was quite blue and was pulseless. Artificial respiration was also begun and simultaneously she received 150 grammes of glucose per the oesophageal tube. She recovered almost at once and gave no further anxiety that day.

The treatment was begun again after two days rest using smaller doses of insulin and on May 5 she was receiving 64 units. On that day she again showed laryngeal spasm three and three quarter hours after the injection and almost at once became pulseless cyanosed and unconscious. She was given the same treatment as before and quickly recovered. The treatment was permanently discontinued after this as it was felt to be unwise to risk a third occurrence of the complication. She was said to have suffered much from bronchitis in childhood and this may be associated with her laryngeal susceptibility.

Little more need be said about this complication. It is not very common, it is easily and quickly recognized and it responds quickly to the appropriate treatment. So soon as the first stridor is noticed treatment by adrenaline, repeated coramine, artificial respiration and the administration of glucose should be instituted. The intravenous route will probably be useless because of collapse of the veins. As recommended by James a cylinder of 95 per cent. oxygen and 5 per cent. carbon dioxide would be an advantage and this has been added to the equipment of my insulin ward.

Summary

Two cases are described which show at the same time the dangers and the potentialities of Sakel's hypoglycaemic treatment in the psychoses. The first case was that of a female psychotic who had suffered from a schizophrenic insanity for one and three quarter years. After developing

status epilepticus as a result of the insulin treatment she showed such improvement mentally that she was discharged.

The second case illustrates the occurrence of laryngeal spasm during the insulin treatment.

The treatment of both these complications is described and the necessity for constant medical attention is emphasized.

I am indebted to Dr J. Harvey Cuthbert, medical superintendent of West Ham Mental Hospital for permission to report these cases. My warmest thanks are due to Sister Mackenzie and the staff of Ward 6, West Ham Mental Hospital for their skilful nursing and continued enthusiasm. For a translation of Meduna's paper I am indebted to Knoll Ltd. of Welbeck Street.

Clinical Memoranda

Marked Febrile Erythematosis During Treatment with Mandelic Acid

Since Rosenheim's articles dealing with the treatment of urinary infection by means of mandelic acid have appeared in medical papers many thousands of such cases have been successfully treated by this drug and very few complications have occurred. It is possible however, that with its use some practitioners may have noted results similar to those experienced recently in a patient of mine who was undergoing mandelic acid medication, and the following case record may therefore prove of interest.

CASE REPORT

A woman aged 42 who gave a long history of cystoeciae and associated urinary symptoms consulted me on account of urgent frequency of micturition. A bacteriological examination of her urine showed *Bacillus coli communis* and pus cells to be present in considerable quantities.

Treatment was begun with large doses of alkalis and when after a week this afforded no relief cystopurin two tablets four hourly was substituted. This likewise failed to relieve her discomfort and the bacteriological findings in the urine remained as before. As no albumin had been found in the urine the patient was considered to be a suitable case for mandelic acid therapy and this was instituted forthwith the urinary pH being kept at 5.3 by the coincident administration of ammonium chloride by mouth. Methyl red was used as the indicator. This treatment was started on February 10 and was continued uneventfully until February 24 when the patient complained of a generalized pruritus although there was no sign of a rash. As at this time the bacteriological findings were still positive the treatment was continued. On February 27 the suboccipital and submaxillary glands showed some enlargement and were slightly tender. On March 3 besides the pruritus and lymphadenitis the patient complained of a persistent acid taste in the mouth resembling that of the medicine. On March 6 the first negative bacteriological report was obtained but the mixture was continued.

On March 10 in addition to the previous symptoms there was soreness of the gums (the patient was edentulous) and these were found to be injected and swollen. The mixture was then stopped and large quantities of alkaline fluids and glucose were substituted. On March 14 the patient had a marked nocturnal sweat and on the morning of the 15th her temperature was found to be 102.2° F. and there were small red papules on her chin, neck, shoulders and the front of her chest. By

* It should be noted that cardiazol only produces convulsions when used in very large doses and according to a special technique in the case used ordinarily it acts only as a respiratory and circulatory stimulant.

this time the itching had become intolerable and by the evening her temperature was 103.6 F. Two tablets of veramon were given but afforded no relief. On the following day her temperature was 105 F at 8 a.m. and she presented a dismal spectacle. Her face and body were covered with a punctate erythema the rash being most marked on the face and on the extensor aspects of the limbs. The oral mucous membrane was swollen and injected, the eyelids were practically closed with oedema and what little of the conjunctivae could be seen was almost brick red in colour.

Some symptomatic relief was obtained at this stage by a sodium bicarbonate bath followed by the application of 10% calamine co. but the effects were only temporary and in one hour the patient was suffering as badly as she had been before the bath was taken. Fifteen minims of adrenaline hydrochloride 1 in 1000 were then injected subcutaneously and 2 c.cm. of colloidal calcium (Glaxo) were given intramuscularly and within half an hour marked relief was experienced. When the patient was seen the same evening (eight hours later) the temperature had fallen to 102.2 F., and she was more comfortable than she had been for several days. The following morning the temperature was still 102 F., and a further 2 c.cm. of calcium was given intramuscularly. The rash was then beginning to fade and the oedema was diminishing.

On March 18 her temperature was 100 F. and she expressed a desire for solid food. A further 2 c.cm. of calcium was given and this dose was repeated daily for the next two days by which time the temperature was normal and the oedema had almost disappeared although some mild irritation persisted for a while and small dusky petechiae were present in the skin at the sites where the rash had been most marked.

Hadleigh, Essex.

W. L. JAMES

Meningococcal Meningitis Complicated by *Streptococcus haemolyticus* Infection Recovery

The following case seems of sufficient interest to warrant being placed on record.

A youth aged 17 was admitted to the Miller General Hospital on Tuesday January 19. His mother gave the following story. On the previous Friday morning he had gone to work having a sore throat while at work he felt dazed and had collapsed, and was brought home by friends. He was then complaining of headache, backache and feeling feverish and it was thought that he had influenza. By the following Sunday however the headache had become intense and the parents noticed that his head was somewhat retracted.

On admission the patient, a youth of splendid physique had a temperature of 100.6 F., the pulse rate was 88 and the respiration rate 28. He was lying on his side with the knees drawn up and showed some degree of head retraction. There was a pronounced palatal weakness, with nasal regurgitation, but no other evidence of cranial nerve damage. Kernig's sign was positive. In addition he had a herpetic eruption on the back of the neck and showed a well marked "tache cérébrale." On lumbar puncture the fluid first obtained was almost pure pus, and under tension. Microscopical examination gave a polymorphonuclear cell count of 61,000, large numbers of meningococci were seen (shown after culture to be Type II).

The patient was treated by daily lumbar puncture and the administration of large amounts of Parke Davis antitoxin by the intravenous and intrathecal routes. Between January 19 and 26 some 16-80 c.cm. of cerebro-spinal fluid were drained daily and 20-30 c.cm. of antitoxin given intrathecally. Over the same period he also received daily 120 c.cm. of antitoxin intravenously.

On the day following admission he became more delirious and was incontinent of urine, the pulse rate rose to 120—thus marked tachycardia persisting until the end of the illness. After this there was a slight but progressive clinical improvement. By January 26 the cell count had fallen to 1,660 and the fluid withdrawn that day proved sterile on culture. Intra-

venous antitoxin was discontinued after January 29 but lumbar puncture and intrathecal injections of antitoxin were continued with a break every third day. A serum rash appeared on January 27 and lasted three days. There was a recrudescence of his symptoms and signs on January 30 and again on February 3 and a sparse growth of meningococci was obtained from the cerebro-spinal fluid. After February 3 his clinical improvement was maintained for a week. During that period he was having lumbar puncture every other day and antitoxin was being given intrathecally at the same time. By February 9 the cell count had fallen to 600 and the fluid had given two negative cultures. The temperature had then been normal for three days. Since admission he had received a total of 1,650 c.cm. of meningococcus antitoxin (550,000 units).

On February 10 a routine lumbar puncture was performed in the morning and 55 c.cm. of fluid were withdrawn. The same day the patient had vomited spontaneously and his head was again retracted. In the evening he had become suddenly unconscious, with fixed eyes, contracted pupils, and stertorous respiration. His temperature was 103 F. and the pulse rate 130. It was thought that these phenomena were associated with a rise in intracranial pressure due to a block between the third and fourth ventricles. Lumbar puncture was performed for a second time that day and the removal of 16 c.cm. of fluid was followed by a gradual return of consciousness. Next morning the laboratory report on both specimens of fluid withdrawn the previous day showed the presence of streptococci in the film and a rise in the cell count to 1,070. A culture of these specimens gave a profuse growth of *Streptococcus haemolyticus*. A throat swab taken the same day also showed on culture a profuse growth of *S. haemolyticus*. Concentrated streptococcus antitoxin (Burroughs Wellcome) was given on February 11 and 12 (14 c.cm. intrathecally and 70 c.cm. intravenously each day). At the same time 20 c.cm. of protosil were administered intramuscularly. During these two days the patient's temperature was raised, he was drowsy and his head was again retracted. On the 12th the cell count had risen to 8,500 but the fluid taken that day was sterile on culture, and by the same evening there was a definite clinical improvement in his condition.

Only a few cubic centimetres were obtained from lumbar puncture between February 12 and 16, and on the 16th lumbar puncture was "dry." It was thought that a local cord block had developed probably due to a haematoma. During these days the patient's condition again deteriorated and there was an exacerbation of meningeal signs, the discs showed very slight papilloedema. On February 18 cisternal puncture was performed by Dr Harold Pritchard, and 90 c.cm. of clear fluid under pressure were obtained. This was sterile on culture. Again on February 24 there was a sudden marked deterioration in the patient's condition, he complained of severe frontal headache and became drowsy. The pulse rate remained between 120 and 130 but the pulse became very feeble. Cisternal puncture was repeated the next day and 32 c.cm. of clear fluid at a pressure of 250 mm. of water were removed. Following this there was a gradual improvement in the pulse volume and in the patient's condition generally. Cisternal puncture was performed on March 1 for the last time, and at the same time a successful lumbar puncture was made.

The pulse rate now fell slowly to between 80 and 90 and the patient had an uneventful convalescence. There was considerable wasting, and although at first there was marked impairment of memory for recent events yet by the time of his discharge on April 5 his memory had apparently become normal and there was no evidence of any gross lasting damage to body or intellect.

During convalescence swabs taken from the throat and post nasal spaces respectively showed the continued presence of haemolytic streptococci and of meningococci.

I am indebted to Dr Maurice Davidson for permission to publish this case, which was under his care, also to Dr Wm. Smith for permission to publish the pathological reports.

Reviews

THE FUNDUS OCULI

Internal Diseases of the Eye and Atlas of Ophthalmoscopy. By Manuel Uribe Troncoso M.D. (Pp 530 239 figures 15 dollars) Philadelphia F A Davis Co 1937

English works on the fundus are not numerous. The classical atlas by Adams Frost published in 1896 is still the outstanding contribution to the subject, though it 'dates' nowadays and is in any case unobtainable. Wilmer's atlas, published in 1934 in the United States, was a brave, but not altogether successful, attempt to replace it. Of the lesser monographs none have the width or scope which mark the permanent contribution. It is therefore a pleasure to welcome Troncoso's *Internal Diseases of the Eye and Atlas of Ophthalmoscopy*. The title of the book is not quite happy. A textbook on fundus lesions the book certainly is, but fundus lesions and internal diseases of the eye are not synonymous. Iritis, cyclitis and cataract deserve just as much the designation of internal disease as a fundus lesion, and these are not subjects discussed in this book.

As a survey of fundus lesions the book is a valuable exposition of the modern outlook on the subject. The author has been radical in his rejection of terms and points of view which have ceased to have any meaning, that this is no small praise will be obvious to anyone who turns over the relevant pages in even the most modern of ophthalmic textbooks. He has discarded the misleading term of retinitis given to that large group of retinal lesions where there is no evidence of an inflammatory basis and uses instead the more innocuous name of retinosis just as choroidosis replaces a good many conditions generally named choroiditis. It is, however, in other things than the nomenclature important though that is, that the author's modernity is apparent. Gone is that approach to fundus lesions which described the clinical picture in hybrid terms compounded of doubtful anatomy, fallacious pathology and linguistic barbarisms.

Macular degeneration and 'pigmentary disturbances' do not loom large in his attempt to describe and explain central fundus lesions. A thorough acquaintance with the literature has given the author the opportunity, of which he has made full use, to reduce the chaos of conflicting and overlapping nomenclature to a few underlying general principles, so that the different chapters do not degenerate into a catalogue of names. In a certain ophthalmic encyclopaedia twenty six varieties of choroiditis are described, that the majority of the names ever had any meaning to anyone, even to those who introduced them is more than doubtful. It is good to find a comprehensive book which has broken away from the tradition that it takes eternity to remove an exploded fallacy from textbooks. It must not be assumed that Dr Troncoso has written a revolutionary tract on fundus lesions. What he has done is to put in textbook form the actual practice of the expert ophthalmoscopist. His book is modern in the best sense of the word. He has had the courage to try the new and to hold fast to what is good in the old.

That a book of this kind should have flaws is regrettable but inevitable and it is in the hope that they will be removed in an early new edition that these flaws are stressed. In an exposition of modern ophthalmology to speak of disturbances of menstruation as a cause of papillitis is an act of ancestral piety, the mention of

chlorosis in the same context is an anachronism. "Oto-genous optic neuritis" is not a particularly clear picture. The use of diaphoretics and cathartics as a treatment of optic neuritis puts the wrong emphasis upon what should be a part of general treatment. Here and there teaching departs from orthodoxy, as when acute papillitis is given as a manifestation of disseminated sclerosis. Elsewhere lack of proportion is apparent, as in the pages giving uncalled for elementary exposition of general disturbances in pituitary diseases and a very full account of various pituitary tumours. An equal lack of balance is seen in the chapter devoted to nephritis. The statement that the histological findings in diabetic retinitis are similar to those in renal retinitis is unwarranted. The grouping together of Tay-Sachs disease with cerebro-macular degeneration, though a common view, is surely no longer tenable. On the histology of disciform degeneration of the macula no mention is made of the strong evidence that the underlying cause is not vascular, but thickening of the membrane of Bruch. A second edition might profitably be revised on many such matters of detail and a careful reading of the proofs would not be out of order. What is a more serious defect in a book of this kind is the lack of references. This should be remedied. Such few references as are given are distinctly invidious.

TREATMENT OF DELINQUENCY

New Light on Delinquency and its Treatment. Results of a Research Conducted for the Institute of Human Relations Yale University. By William Healy M.D. and Augusta F. Bronner Ph.D. (Pp 226 9s net) New Haven, Yale University Press. London H. Milford, Oxford University Press 1936.

In undertaking yet another study of delinquency Dr William Healy and Dr Augusta Bronner, from their long experience, approached delinquency as one form of human behaviour and not merely as a kind of behaviour which injures society. They concentrated on the family life of delinquents in the United States and compared a large number of delinquent children with an equal number of non-delinquent children in the same families. They have striven throughout to discover what a particular delinquency means to the delinquent in terms of the expression of his desires or urges. From this point of view they have made practical suggestions for treatment. Only those children were selected who were recognizable as potentially serious offenders or who had been repeatedly delinquent. The authors took one girl to three boys, the ordinary ratio of juvenile court cases, and ruled out the definitely feeble minded. They gave preference to families with a comparable non-delinquent sibling especially where the delinquent was one of twins.

The material was taken from several cities and tested and examined with great thoroughness. The authors discovered that delinquency was very largely determined by the subjective life of the delinquent rather than his environment and that the delinquent is a child with different emotional experiences and attitudes from those of others. His desires for satisfactory human relations, for recognition as a personality for social adequacy, independence, accomplishment, experience, and possessions have somehow been thwarted. He therefore tries to escape from the unpleasant situation to achieve compensatory satisfactions such as adventure and notoriety to bolster up the ego to take revenge and to satisfy instinctual urges and last but not least, to achieve punishment in response to a conscious or unconscious sense of guilt. The ideas of delinquency are always

present to every child, and if they fit the special needs of the individual he becomes delinquent

Treatment based on the discoveries here outlined was very encouraging, and the authors' most important contribution to the subject is a detailed treatment programme, the central idea of which is to provide satisfactory relationships and outlets. Naturally they plead for a reorganization of the whole social environment. It is not surprising that delinquency is a problem in a country where it is so persistently and emphatically represented, in the newspapers and the picture theatres, as an attractive mode of behaviour.

OPERATIVE SURGERY

Operative Surgery. By Alexander Miles M.D. I.L.D., F.R.C.Sd., and D. P. D. Wilkie M.D., F.R.C.Sd. and Eng. Second edition (Pp 631 329 figures 21s net) London H. Milford, Oxford University Press 1936

We welcome a second edition of this manual by Mr Alexander Miles and Sir David Wilkie. The first edition, which came to light in 1933, succeeded the companion volume to the well known textbook of general surgery by the late Alexis Thomson and Mr Alexander Miles. Like its predecessor, the work retains what was useful and attractive in the original companion volume, and omits much that was of academic interest only—for example, such operations as have been designated dissecting room exercises, it also brings up to date the account of surgical practice. Gynaecology is not dealt with. The present volume gives an account of the operations which are being practised to-day by the Edinburgh school of surgery, and both the authors and the publishers are to be congratulated on the clarity of the descriptions and the illustrations, and on the format of the work. In addition to the principal authors coadjutors number seventeen, and are members of the staff either of the Edinburgh Royal Infirmary or of the Edinburgh municipal hospitals.

This is essentially a textbook of operative surgery for the undergraduate and the young surgeon, and as such is one of the best we have read. We should like to have seen the Billroth I procedure shown in Figure 237 as an operation for gastric ulcer, and we think Figure 163 might have been omitted, since the trans sphenoidal operation for pituitary tumour is only of historical interest. The same might be said about Figure 268, which depicts the use of the Murphy button. These are minor criticisms, however, and the new edition should increase the appeal of this already popular work among medical students and their teachers.

CARDIOVASCULAR DISEASE

Die Herz- und Gefässkrankheiten. By Professor Walter Frey (Pp 342 67 figures RM 29 geb., RM 32 60) Berlin J. Springer 1936

This work deals with the subject of disease of the circulatory system from an unusual point of view and the author aims at treating it on a very wide basis. The book is divided into five sections, the first of which is introductory and indicates the general plan. The organs of mesodermal and mesenchymal origin are considered as a pathological unit, and this theme runs through the volume. In later sections the morbid processes which affect tissues with this embryological origin are described. To begin with there is a full description of the development of the heart and congenital defects, but the various types rather lack definition and the diagrams are somewhat out of date. Then follows a review of the changes produced in the heart throughout life by growth and

age, including observations on the relation of this organ to the shape and size of the body—an interesting section and a novel survey. The next part is devoted to indurative lesions—what the author calls the scleroses—such as aortic, valvular, and coronary sclerosis and peripheral arteriosclerosis. Under the second heading the whole subject of heart failure is considered. Atheroma of the aorta and its treatment receives rather an undue amount of space. The section that follows deals with lesions of bacterial and toxic origin, and discusses myocarditis, endocarditis, and pericarditis, as well as arteritis and phlebitis. Finally there is a section on endocrine disorders and neurosis.

By reason of its peculiar approach to the subject the book is hard to read, and there is in places undue emphasis on matters which are of no great clinical importance. The chief value of the work lies in the breadth of view displayed and the stimulating generalizations. A cardiologist will find here much out-of-the-way information, but others may tend to be confused. The bibliographies are not tabulated in the usual way, nor are the references conventionally given, and the index is scanty. There are minor mistakes in English and French. Only half a dozen electrocardiographs are reproduced, and these are small and indistinct.

NOSE AND THROAT DISEASES

Diseases of the Nose and Throat. A Textbook for Students and Practitioners. By Sir StClair Thomson M.D. F.R.C.P. F.R.C.S. LL.D., and V. E. Negus M.S., F.R.C.S. Fourth edition (Pp 976, 386 figures, 29 plates, 45s net) London Cassell and Co 1937

After the lapse of a decade Sir StClair Thomson has produced a fourth edition of his well known textbook on diseases of the nose and throat, this time with the assistance of Mr V. E. Negus. The author states in his preface that more changes have been made than in the second or third editions, but the book appeared to have reached its apogee in the third edition, and with the exception of a new and fuller description of endoscopy the changes mostly appear as variations in matters of detail rather than in essentials.

The principal alteration consists in the complete re-writing of the sections relating to endoscopy, and along with this a number of excellent fresh illustrations are included. This portion indicates very well what can be accomplished by endoscopy in the diagnosis and treatment of disease besides the extraction of foreign bodies. Tumours of the nose and accessory sinuses are now grouped in a chapter together. Although the achievements of Holmgren and Öhngren in Stockholm and of Gordon New at the Mayo Clinic are mentioned, a true perspective of the revolution which these surgeons have effected in the treatment of cancer of the upper jaw and ethmoid is hardly conveyed. Other short sections are devoted to agranulocytosis and to the Plummer-Vinson syndrome, which was first described by Donald Paterson and Brown Kelly. The difficult question of the syndromes arising from paralysis of the last four cranial nerves is clarified by adopting the classification advocated by Burger.

As might be expected, the discussion of tonsils has been revised, though no claim is made to solve the problem and some observations on the technique of their removal are also new. The authors now advocate the use of the Davis gag, a complicated apparatus which has become fashionable in recent years. The drawings illustrate it upside down according to the manner in which it is commonly used. Six pages are still devoted to a descrip-

tion of the properties and use of cocaine, whilst pantocaine, which has almost entirely replaced it on the Continent, receives one line. It must be noted with regret also that some of the more depressing woodcuts and photographs are still retained, and that the names of a number of the authors quoted are either wrongly spelt or are in some way inaccurate. This may not be of great importance, but it shows a slight decline in literary finish. These remarks, however, only serve to indicate the difficulties the authors have had to face in combining the old and the new, and they have succeeded well in their long and arduous task, which now completed will maintain the well-established position of the book for many years to come.

Notes on Books

Sir HENRY M W GRAY has brought together in small compass his views on *The Colon as a Health Regulator* (Macmillan, 10s 6d). The author sees in developmental anomalies of the colon, incomplete migration and fixation in embryonic life the cause of most of the symptoms presented by patients suffering from what is known as "the chronic abdomen," and the basis for many extra-abdominal conditions as widely separated as epilepsy and chronic arthritis. For their removal he advocates a general abdominal overhaul, what he describes as a spring-cleaning with division of adhesions, unravelling of kinks, and fixation of some portions of the colon such as the caecum and sigmoid. The details of the operative procedure are given. After a fairly prolonged abdominal operation the patients get out of bed on the fourth or fifth day and are often able to return to sedentary business at the end of a month. There were four deaths in a series of 205 cases; this does not accord with the statement on the same page that "complete failure to relieve has to be recorded occasionally, possibly in 1 per cent of cases." Other claims, unsupported by figures, may be even wider of the mark.

Medical Morals and Manners by Dr H. A. ROYSTER, is a collection of papers and addresses written and published during the last forty years (London: H. Milford, 11s 6d). The author is an American surgeon with a deep interest in literature, social relations and athletics. The thirty chapters of the book are grouped in five divisions, of which the largest is devoted to surgery, three of the remainder deal with the general aspects of medical practice with athletics and physical fitness, and with hospital staffs while the concluding pages comprise a miscellany including "James Marion Sims" and "The Medical Phrases of Victor Hugo." Dr Royster is a strong upholder of culture in medicine. Will it be considered very old-fashioned if we should suggest that the neglect of the languages and particularly the banishment of Greek may be responsible for our loose thinking and our lack of scholarship? He deplores modern inaccuracy. "We know a great deal but do we know anything very well?" One of the most interesting chapters is "From My Father's Notebook" which includes case reports of difficult obstetric experiences in the eighteen seventies. Also very entertaining and instructive are the short biographies of other old-time country practitioners.

A Manual of Operating Room Procedures is a loose leaf book written by ALMIRA W. HOPPE and LUCILE M. HALVERSON, assisted by the operating room nursing staff of the University of Minnesota Hospitals (London: H. Milford 9s). Dr O. W. Wangensteen in a foreword writes that "Order is Heaven's first law" and that this is also the first mandate of the operating room. It appears to be the theme also of this handbook which is a guide to the efficient conduct of surgical operations regarded from the standpoint of the theatre nursing staff. The book includes instruction in the preparation for and conduct of

operations, and, to add interest to what otherwise might be rather dull lists of the instruments required for particular operations, the purpose of each operation and a brief outline of the steps of its performance are given. We suggest that this interest might be further enhanced in future editions by the inclusion of line drawings showing the position of the patient and other points of special interest. All branches of surgery are considered in this work, which comprises 234 loose pages, an index, and some additional blank pages for making notes such as the requirements for individual variations in technique and the use of specially designed instruments used by certain surgeons. We note that craniotomy and ventricular tap come under general surgery. This should prove a valuable handbook for theatre nursing staffs, and the conception and arrangement are excellent.

Preparations and Appliances

INTERCEPTOR AND REGULATOR FOR CONTINUOUS INTRAVENOUS SALINE

Mr HAMILTON BAILEY, FRCS writes

The piece of apparatus illustrated in the accompanying figure is a valuable addition to the armamentarium for administering continuous intravenous saline. The rate of flow can be regulated with great precision. The large glass bulb

obviates the drip becoming obscured by an accumulation of solution—a constant source of trouble in other patterns of interceptors. The apparatus is made by the Genito-Urinary Manufacturing Co., Ltd. London.

"SEEDLAX"

"Seedlax" is composed chiefly of flax seed and wheat germ. It therefore contains substances which act as an intestinal lubricant and in addition contains vitamins—in particular members of the vitamin B complex. The purpose of the preparation is to act as a mild laxative in cases of chronic constipation; it also provides a supply of the vitamin B complex a lack of which is suspected of being a contributory cause of atonia of the bowel.

ONE HUNDRED AND FIFTH ANNUAL MEETING OF THE BRITISH MEDICAL ASSOCIATION BELFAST, 1937

THE one hundred and fifth Annual Meeting of the British Medical Association will be held in Belfast next summer, under the Presidency of Professor R J Johnstone BA MB, FRCS FCOG MP consulting surgeon, Royal Maternity Hospital gynaecologist to the Royal Victoria Hospital and professor of gynaecology, Queen's University, Belfast, he will deliver his address to the Association on the evening of Tuesday, July 20. The Sectional Meetings for scientific and clinical work will be held on Wednesday, Thursday, and Friday, July 21, 22, and 23, the morning sessions being given up to discussions and the reading of papers. The Annual Representative Meeting for the transaction of medico political business will begin on the previous Friday July 16. The full list of officers of the seventeen Scientific Sections the provisional programme and time-table information about accommodation and other details of the arrangements for the Annual Meeting were given in the *Supplement* of May 15. We publish below the third of a series of articles on Belfast and its medical and scientific institutions. The first article appeared on January 30 (p 233) and the second on April 10 (p 766).

THE QUEEN'S UNIVERSITY OF BELFAST AND BELFAST HOSPITALS

The Queen's University of Belfast is the centre of academic life in Northern Ireland. Its record of progress as it approaches its centenary is a reflex of the intellectual life and outlook of the community and of its interest in the arts and sciences. It is an interesting commentary on the relative importance of the towns of Ulster ninety years ago that serious consideration should have been given to the claims of Derry and Armagh as the home

Galway) the affiliated colleges constituted the Queen's University of Ireland. The formal opening took place in 1849, in which year Queen Victoria visited the institution which has since borne her name. From many stand points the times might have been regarded as unpropitious. The shadow of the Great Famine still hung over the country, and a feeling of political unrest brooded over Europe and manifested itself in the wave of revolution

The Queen's University of Belfast

of the projected seat of learning. It is a tribute to the discriminating foresight of that generation that the College which was later to develop into the University was established in what was destined to be the metropolis of Northern Ireland and the centre of its industrial activity.

Queen's College Belfast, was founded by Act of Parliament on the initiative of Sir Robert Peel in 1845. Together with the other Queen's Colleges (at Cork and

which spread over every country, yet the demands for better educational facilities took shape in the midst of these major troubles. For thirty years the Queen's University of Ireland supplied the higher academic requirements of Belfast and Ulster, and numbered among its scholars eminent lawyers, clergymen, doctors, scientists, and administrators. Sir Robert Hart, Sir William MacCormac and Sir Joseph Larmour being of that number. In 1882 the Queen's University of Ireland was

dissolved to give place to the Royal University of Ireland. This was modelled upon the then constitution of London University, being purely an examining body and not responsible for teaching. Arising from various causes a period of acrimonious discussion extending over some thirty years followed, until in 1908, the Irish Universities Act was passed making provision for the establishment of the National University of Ireland (in Dublin) and the Queen's University of Belfast. Thus has evolved the present centre of academic culture and learning in the capital city of Northern Ireland.

The University is situated on University Road about a mile from the city centre with the Botanic Gardens Park (Belfast's most beautiful park) as its next door neighbour. To the original building opened in 1849, many additions have been made, and the staff has been constantly increased. The west front with its massive buttresses and stone facings forms a noble façade and presents an excellent example of architecture in brick. Age has imparted a mellowing touch to the rich Belfast brick which converted the plans of Sir Charles Lanyon the architect, into a reposeful building. Fronted by trim and ample lawns its harmonies of perspective in any combination of light and shade, are a never failing pleasure to the eye, bathed in the glow of the setting sun or in the glamour of moonlight the charm is indescribably deepened.

Growth of Faculties in the University

In 1901 a Better Equipment Fund was inaugurated by the then President of the College (Dr Hamilton). In 1908 under the Universities Act additional grants were made to the funds. These welcome accessions stimulated a development which had been all too slow in providing adequate equipment worthy of the teachers who had been carrying on amidst great difficulties in respect of accommodation and teaching facilities. The intimate contact between university life and the main current of national life which is being increasingly recognized by communities everywhere to-day as of inestimable value had not then been established. Happily Queen's University is now in close relationship with the primary and secondary schools throughout Northern Ireland and the

various county borough and county councils have evinced additional interest in the University by providing scholarships and by making grants to University funds. Some years ago the Senate identified the University with the commercial and industrial life of Belfast by recognizing the Municipal College of Technology as a college in which

students might pursue their studies in the appropriate faculty of applied science and technology. In 1924 a faculty of agriculture was established as an evidence of the close relationship between the University and the Ministry of Agriculture and of their common interest in the farming community and their desire to further agricultural training and research work.

With the establishment of the University in 1908 faculties of arts science medicine, law and commerce were formed. In recent years other faculties have been instituted that of applied science (1921) agriculture (1924) and theology (1926). During the past forty years laboratories have been built additional lecture theatres provided and modern equipment supplied, but the need for larger and more numerous buildings to meet the demands imposed by the increasing number of students is clamant. In 1909 there were some 600 students to-day the number is 1,568 of whom 653 are medical. The

Students Union was built in 1897, and extended in 1908 and again in 1933. The Better Equipment Fund amounted to over £100,000 and provided the sum necessary for the erection of chemistry pathology and physiology laboratories. The grants made on the founding of the University in 1908 made possible further extensions and the creation of the physics laboratories. Sir Richard Livingstone during his ten years as Vice-Chancellor (1923-33) made numerous appeals to the

citizens and was untiring in calling public attention to the urgent needs of the University. During his tenure of office the faculty of agriculture was instituted and the admirable agricultural building in Elmwood Avenue erected. Unfortunately in the eyes of the community the University has been regarded in the light of a Government institution bountifully supported by Sir grants. The frequent appeals of the Vice-Chancellor called for to remove this misapprehension and to

The Whitla Medical Institute Belfast

The Mater Infirmorum Hospital Belfast

Royal Victoria Hospital Belfast

attention to the inadequacy of the annual income and paucity of benefactions. In 1930 a University Guild was formed, composed of prominent citizens who are encouraged to interest themselves in the University and its needs. The present Vice Chancellor, Mr F W Ogilvie is carrying on the work so ably initiated by Sir Richard Livingstone, in the hope that the years to come may bring to harvest the seeds which have been sown, and thus help to sustain the development of this centre of learning and research.

The University Buildings

Immediately to the right of the main entrance hall which is contained in the main tower of the west façade, is the Great Hall with its lofty roof and mullioned windows. On the walls is a collection of portraits of past presidents, teachers, and benefactors as well as a reproduction of the famous "St Peter the Martyr" (Titan), the original of which was destroyed by fire in Venice.

From the entrance hall admission to the quadrangle is gained. Around this are grouped the various buildings, containing lecture theatres, laboratories, museums, etc., of the respective departments.

The medical building, one of the oldest, is at the eastern side, and contains two excellent museums. The anatomical museum houses many valuable specimens prepared by Johnson Symington, in the medical museum are numerous pathological exhibits in addition to a unique collection of specimens illustrating various fractures of bones and development of the human skeleton—a further memorial to the in-

dustry of Symington. On the southern wing is the most recent addition to the University, combining in an architectural masterpiece, two buildings of entirely distinct periods in a scheme which enhances all three. Here is the Senate room, a handsome chamber panelled in natural oak and furnished accordingly.

The library is a detached building on the north side of the University proper, it was erected in 1867 and enlarged in 1914. It contains some 135,000 volumes and manuscripts, including many valuable personal collections presented by interested benefactors. The Students Union is another separate building occupying the north-east corner of the grounds. Built in 1897 it has admirably fulfilled its intended purpose as a social and educational centre.

The increasing number of students necessitated the provision of a dining room the accommodation of which had in recent years been unduly taxed. The Pilgrim Trust came to the rescue, and a handsome new dining hall, built in the Tudor style, was added to the western aspect as a gift from the Trust at a cost of £10,000. The gift was most opportune and the opening in 1933 was the occasion for a characteristic address breathing

The Royal Maternity Hospital

high ideals and lofty purpose by Mr Stanley Baldwin. The Queen's University Contingent of the OTC was formed in 1908, and is provided with a suitable drill hall and parade ground.

Recently the University converted the terrace of houses on the opposite side of University Road, known as Queens Elms, into a hostel for men students. This is but a gesture towards fulfilling what has been a clamant

need for many years, and is the first step in providing men students with a residential hostel similar to that provided for women by the munificence of the Misses Riddell at Riddell Hall

The Medical Faculty

The Belfast Medical School dates from 1818, when lectures were given in the Academical Institution in anatomy, physiology, and chemistry. The school, begun so modestly and unpretentiously, became firmly established largely as a result of the enthusiasm of James McDonnell (a native of the Glens of Antrim). In 1835 chairs of surgery, midwifery and materia medica were added, and in the following year chairs of medicine and botany were created to form the Belfast medical faculty, in connexion with the Academical Institution and the General Hospital. With the establishment of the Queen's College the faculty was recognized by the Queen's University of Ireland, and since then a succession of famous teachers has held the attention of a multitude of students, many of whom were destined in their turn to become famous. James McDonnell, Henry MacCormac (the father of Sir William), Peter Redfern, Alexander Gordon, James Cumming (president of the B.M.A. in 1884), Lorrain Smith, T. H. Milroy, Johnson Symington, Sir William Whitla (president in 1909) and Andrew Fullerton are names not readily forgotten in the realms of medical science and teaching. They are engraved on the records of the Belfast Medical School upon whose roll appear the names of men who played a magnificent part in expounding the tenets of practical medicine and who were conspicuous for the originality of their outlook upon the problems with which they were confronted in their generation.

The medical faculty has always played a predominant part in the undergraduate life of the University. Out of 1,568 students no fewer than 650 belong to this faculty. Of the number who qualify annually only a small proportion practise in Northern Ireland; the majority establishing themselves in England, in the Colonies, and the Services, so that medical Queensmen are found in prominent positions in the Crown Colonies, the Indian Medical Service, the Army and Naval Medical Services, as administrators in State and municipal services, and as heads of departments in the War Office, the Admiralty, and the Air Force.

The Belfast Hospitals

The clinical teaching of students is amply catered for in the various city hospitals. The visitor will be impressed by the facilities available and will perhaps be envious that his days as clinical clerk or surgical dresser are but a memory.

The Royal Victoria Hospital is the largest centre of clinical teaching in Ireland. It owes its origin in 1792 to a dispensary to the enthusiasm of James McDonnell, the debt to whose memory can never be repaid. A few years later a fever hospital was built, and in 1817 the General Hospital was opened in Frederick Street during a terrible epidemic of typhus fever (the victims were carried into the new buildings whose freshly plastered walls were still dripping with moisture and whose stairways had been rendered secure by the overworked carpenters and masons). Many of the older members of the profession in Belfast speak with reverent thoughts of the days in the old hospital in Frederick Street, but the building has recently been demolished and this link with former medical teaching has now disappeared for ever. This General Hospital was enlarged to 180 beds and became the Royal Hospital in 1875. Towards the end of the century it was recognized as being totally inadequate in its capacity and out of date as a hospital for modern needs. The story of the present magnificent institution opened in 1903 by King Edward VII is the record of the enthusiasm and personality of the late Viscountess Pirrie (wife of the former head of the famous shipbuilding firm of Harland and Wolff Ltd.).

The hospital is built upon a site granted by the city corporation. Much discussion took place as to the best situation, but the choice has proved more fortunate than was contemplated by the far-seeing citizens of thirty-seven years ago, because the Royal Victoria Hospital is now the centre of a colony of hospitals which includes the Royal Maternity Hospital, the Belfast Hospital for Sick Children, the Queen's University Institute of Pathology, a Private Patients' Pavilion, and a new Nurses' Home. Work will soon start on further extensions as a memorial to the late King George V. These are all accommodated on an estate of twenty-five acres, formerly occupied by the Lunatic Asylum.

All the wards of the main hospital are on one floor and branch off the southern side of a corridor almost 600 feet long. Each pair of wards is a 'unit' under the control of a physician or surgeon, complete with its own ward kitchen, clinical room, lecture theatre, and operating theatre (in the surgical units), heating and ventilation are by the plenum system. It is difficult to keep pace with the developments of the hospital, but the visitor will be impressed by the progressive outlook of those responsible for the care of the sick and by the onward march of scientific research and treatment. The institution at present has 436 beds, with complete radiological, electrotherapeutic and massage departments, as well as a complete floor in the Queen's University Institute of Pathology close by, where clinical pathology and bacteriology are housed.

The Royal Maternity Hospital

The Royal Maternity Hospital is one of the oldest Belfast charities, having been founded in 1794. The old Belfast Maternity Hospital in Townsend Street carried on for many years under serious disabilities of cramped accommodation and inadequate equipment. It became unsuitable as a teaching hospital for midwifery. Amalgamation with the Royal Victoria Hospital was the dream of the progressive element of the Board of Governors. Fortunately this has come to pass, and now the hospital, while autonomous, shelters under the wing of its stronger partner. The new hospital, opened some four years ago, has attracted widespread interest as a practical conception of a modern maternity hospital, and those interested in hospital building, equipment, and administration will find ample material for study and imitation. The hospital has accommodation for 100 patients, including antenatal wards and a private department for paying patients.

The Institute of Pathology

Adjacent to these buildings and connected with the Royal Victoria Hospital by an overhead corridor is the Queen's University Institute of Pathology. Successful negotiations between University and hospital authorities resulted in the transfer of the department of pathology from the University to the hospital, with the result that the present arrangement typifies the proper relationship and common interest that exist between the two bodies. The building was erected in 1930 on three floors, one for bacteriology, one for pathology, and the top floor for hospital bacteriological and biochemical departments. Each department is generously provided with suites for research workers, and within the building are contained teaching laboratories, lecture theatre, museum for the display of selected specimens (each furnished with a complete clinical file) and a pathology library.

The Belfast Hospital for Sick Children

The Belfast Hospital for Sick Children remains an independent unit, but its close proximity within the grounds gifted by the city corporation entitles it to be included in the description of the hospital colony. It was founded in 1873 as a dispensary with six beds, and was enlarged to a small hospital in Queen Street built in 1879. It is unique in that it is the only hospital in Ireland which devotes itself solely to the care of sick

children Various extensions were made from time to time, but its situation within a very short distance from the city centre limited its development and determined its removal to a more suitable site on the Falls Road The present hospital, built in 1931, has accommodation for eighty four children, and possesses a large out patient department with ample room for future development A recent gift of £15,000 for the provision of a private patients department is an index of the interest with which the hospital is regarded by the beneficent

The Mater Infirmorum Hospital

This is the only other general hospital besides the Royal Victoria under the voluntary system It consisted originally of a house gifted by a former Roman Catholic Bishop of Down In a few years the house was demolished and a handsome hospital was built upon the site In contrast to the sister hospital it is constructed on the pavilion system in a very attractive style The extern department has recently been rebuilt to meet the increasing demands upon its services There is a modern radiological department and laboratory so that the 'Mater' contributes its quota to the clinical teaching supplied by the Belfast hospitals A recent addition is Beechmount Hospice for chronic cases which has brought the total number of beds up to 300 The nursing is carried out under the supervision of Sisters of Mercy, but patients of any religious creed are freely admitted

The Ulster Hospital for Children and Women

This is the only hospital on the County Down side of Belfast It was established in Fisherwick Place in 1873, but was moved in 1891 to Templemore Avenue in the populous working-class district of Ballymacarrett The nucleus of the present hospital built in 1912 at a cost of £10,000, soon proved unequal to the many demands made upon its services Intelligent extensions according to a preconceived plan have been made at intervals until to-day it is one of the most modern institutions It has a large out-patient department for children and women, and the extensions recently opened make available eighty cots for children and twenty beds for gynaecology It is closely associated with the Institute of Pathology and the other teaching hospitals

The Belfast Fever and Mental Hospitals

Those who are interested in fever and mental hospitals should make an effort to visit either or both of these institutions They are established on a 450 acre estate at Purdysburn, two miles from the Malone and Ormeau tram termini and about six miles from the city centre The fever hospital consists of six pavilions under the modern system of construction and administration The Belfast Mental Hospital occupies the larger portion of the estate, the villa system having been adopted with great success from the points of view of treatment and organization

The Ophthalmic Hospitals

There are two ophthalmic hospitals for the treatment of eye, ear, and throat conditions (in addition to the appropriate departments in the general and children's hospitals) The Belfast Ophthalmic Hospital founded in 1867, in Great Victoria Street, like all the Belfast hospitals, has been enlarged in recent years and now has modern theatres, up-to-date equipment, and a clinic for the treatment of squint The Benn Ulster Eye, Ear, and Throat Hospital in Clifton Street was built in 1874 It carries on a valuable service on modern lines, being one of the first of the Belfast hospitals to provide facilities for paying patients

Other Hospitals

The Samaritan Hospital for Women (Lisburn Road) was the first Belfast hospital to undertake extensions after the war It was established in 1874 being a further manifestation of the interest and generosity of the Benn family The Forster Green Hospital for Diseases of the Chest and Tuberculosis is beautifully situated at Fort-breda just beyond the Ormeau Road tram terminus The present institution was provided by the late Mr Forster Green in an estate of forty five acres Additional beds have been provided from time to time to meet the demands for modern treatment A nurses home to accommodate increased staff has been added within recent years and the equipment has been supplemented by the addition of modern aids to diagnosis and treatment

The Municipal Sanatorium at Whiteabbey and the Hospital for Surgical Tuberculosis at Graymount occupy a sheltered site beneath the rugged mass of the Cave Hill They are situated on a gentle elevation with a splendid view of Belfast Lough, and provide facilities for the most modern treatment of tuberculosis which can be available convenient to an urban area

The Belfast Union Infirmary

The Belfast Union Infirmary, controlled by the Board of Guardians, is utilized for auxiliary clinical teaching The children's department has been reorganized so that the new buildings provide every modern aid towards diagnosis and treatment The Jubilee Maternity Hospital opened in 1935, is a further tribute to the progressive spirit of the Board in providing a modern maternity hospital which compares very favourably with its counterpart the Royal Maternity Hospital

The Whitley Medical Institute

The story of the Belfast Medical School would be sadly incomplete without mention of the name of Whitley Members of the Association who visited Belfast in 1909 will recall the memorable year marked by the presidency of the late Sir William Whitley, but the school will ever remember his name for his contributions to medical literature and for the munificence of his gifts The Whitley Hall, recently built at the Methodist College and a still larger hall to be placed in the grounds of the University are but further expressions of the already magnificent generosity displayed in providing the Ulster Medical Society with its Medical Institute On Sir William's death, three years ago, the designation of the Institute was changed to bear his name, and it has now become familiar to many visitors (by correspondence) as the headquarters of the local executive committee for the forthcoming annual meeting It is the home of the Ulster Medical Society, who very generously placed the building at the disposal of the committee Its handsome library has been the centre of the activities of the past weeks and has proved an ideal venue for the work and meetings of the various committees

The Ulster Medical Society dates from 1862, having been formed by the amalgamation of the Belfast Medical Society (founded in 1806) and the Clinico-Pathological Society (founded in 1853) It numbers many famous names among its presidents and fellows, past and present The Institute was the gift of Sir William on the occasion of the annual dinner of the society in 1901 It contains a library committee rooms lecture theatre, billiard room, and steward's quarters The lecture room seats 200 and here the annual dinner is held as well as meetings of the Ulster Medical Society the Branch and Division of the British Medical Association and other medical bodies

One of the features of the Institute is the stained glass panel erected over the fireplace in the library It is a

memorial to the late Dr William Smyth of Burtonport (Co Donegal) The Countess of Dudley (Vicereine of Ireland at the time), in unveiling the window, paid a glowing tribute to the man who, when all others refused to help, carried food and medicine to the people of the typhus stricken island of Arranmore, and who eventually died of the fever contracted from the patients he had succoured. Helping him was Dr Brendon McCarthy, both of whom, Lady Dudley said, were everyday heroes, totally unconscious of having performed any unusual act of heroism.

THE TUBERCULOSIS ASSOCIATION

PROVINCIAL MEETING AT MANCHESTER

The annual provincial meeting of the Tuberculosis Association was held in Manchester from June 10 to 12 under the presidency of Dr S ROODHOUSE GLOVE. The meeting had been arranged jointly with the North Western Tuberculosis Society. Papers were read in the lecture hall of the Central Library, and a visit to the Manchester Sanatorium at Baguley, where members were entertained by Dr H Trayer, the medical superintendent, took place on Friday afternoon. In the evening the annual dinner was held at the Midland Hotel. The Lord Mayor and Lady Mayoress of Manchester, and Professor J S B Stopford, Vice Chancellor of the University of Manchester, and Mrs Stopford, were among the many distinguished guests of the association.

Collapse Therapy

The first subject for discussion was how long should collapse therapy be delayed. In opening Dr GEOFFREY MARSHALL said that the production of an artificial pneumothorax was only contraindicated in cases in which the lung volume was very deficient, as in emphysema, and when there was a large superficial cavity with adherent walls. Infiltration of the opposite lung might not be a contraindication, but it should at least cause some delay. Extrapulmonary complications such as tuberculosis of the larynx or intestines were indications rather for the acceleration of artificial pneumothorax treatment.

Phrenic interruption by crushing or by evulsion rarely caused a serious reaction, and was applicable either with an artificial pneumothorax or in those cases in which it was impossible to induce a pneumothorax. Apicolysis and plombage he described as having waxed and waned in the approval of chest surgeons. He believed that this operation was still practised mainly because it produced pretty x-ray pictures—which bore no relation at all to the patient's clinical condition. Thoracoplasty was often delayed until all the less drastic methods had been tried and had failed. Patients regarded it as a last line of defence—a view which was probably correct. It was a severe operation which should never be performed while there was any active or increasing disease process in the lung. It should be undertaken only after prolonged medical treatment had raised the patient's resistance to infection. A well timed intervention made it possible for Nature to heal cases in which the damage might otherwise have been considered irreparable.

Mr H MORRISON DAVIS discussed the same problem from the surgical point of view. He said that when thoracoplasty proved successful in obliterating lung cavities then the case was little doubt as to the permanence of the cure. But after partial thoracoplasty recurrence in a lower lobe was possible and did occur. The relief of symptoms afforded by any form of collapse therapy—though giving a false sense of security which would lead the

patient to take unjustifiable risks. That rest in bed was the basis of all treatment, and that there was no definite order in which to apply the various medical and surgical methods of treatment, were, he believed, axiomatic. The surgeon should insist upon pre-operative rest in bed for at least six weeks. But it was dangerous to wait too long, for there might be an extension of the disease to the other lung which would completely contraindicate any immediate thoracoplasty. On the other hand, in the period of waiting spontaneous healing might, in rare instances, take place. He believed that in any case in which an artificial pneumothorax was shown to be inefficient, and in which adhesiolysis was not feasible, thoracoplasty should be undertaken as soon as possible.

In an interesting discussion on these two papers Mr J E H ROBERTS said that he and his colleagues at the Brompton Hospital in the past had done eighty-four consecutive thoracoplasties in favourable cases and all were discharged well. In a more recent year, when many unfavourable cases were operated on, their mortality was 14 per cent. He believed that the only real test of the efficiency of surgical collapse was the increased expectation of life which could be offered to patients who would otherwise die. In the course of further general discussion Dr MAURICE DAVIDSON, Dr GILMOUR, Dr JAMES WATT, Dr G T HERBERT and Dr P J L DE BLOEME took part. The value of repeated sedimentation tests and of the Schilling test were considered at some length, as was the possibility of gastric complications following left-sided phrenic evulsion.

Bronchiectasis in Pulmonary Tuberculosis

With Dr G JESSEL in the chair Mr J E H ROBERTS read, and illustrated with lantern slides, a short and provocative paper on bronchiectasis in pulmonary tuberculosis. Mr Roberts said that all patients who were classed as cases of chronic fibroid phthisis and who were producing each day three ounces or more of sputum were really suffering from the effects of bronchiectasis. Massive collapse due to obstruction of a bronchus by a blood clot might abruptly follow a severe haemorrhage. The patient might even feel his heart being displaced. Unless there was a rapid re-expansion bronchiectasis would develop. Haemoptysis was more common in bronchiectasis than in tuberculosis, and tended to be more severe. Bronchiectasis was best diagnosed by injecting lipiodol into the trachea and taking a bronchogram. He had never seen any ill effects follow injection into a tuberculous lung, and in at least one American sanatorium bronchograms of tuberculous patients were taken as a routine.

Pleural Effusions after Thoracoscopy

Dr O M MISTAL of Montana, Switzerland, in an interesting paper on this subject, said that pleural effusions were very rare after a simple thoracoscopy, but if they occurred they might be sero-fibrinous, haemorrhagic, or purulent, and appear early or late. Thoracoscopy with adhesiolysis improved the prospects of artificial pneumothorax therapy. Effusions were usually small after thoracoscopy alone but were often large after the division of adhesions. Their appearance might be due to defective sterilization, trauma to pleural tubercles or the freeing of bacilli after cauterization of an encapsulated adhesion containing the prolongation of a cavity in 30 per cent of cases they were said to be due to haemorrhage caused by the anaesthetic. Haemorrhagic effusions usually resolved but occasionally went on to form an empyema. The more rapidly an empyema appeared after the operation the worse was the prognosis. It was important to free all the adhesions because the complication was much commoner after incomplete pleurolysis. In the treatment of empyema he advised repeated aspiration and if necessary wash-outs. Up to four pints of oil might be injected into the pleural cavity in order to create an artificial pneumothorax. For second

infected purulent effusions he described and demonstrated a method of direct ultra violet irradiation by means of a small electrode introduced into the pleural cavity. This instrument which he had devised had a bactericidal effect, and seemed to assist the healing of the tissues. He thought that the complications of adhesiolysis could generally be avoided by good technique and a suitable selection of cases. Their occurrence did not in any way diminish the value of thoracoscopy and pleurolysis which had he believed, improved considerably the results of artificial pneumothorax therapy.

Dr S RODDIOUS GLOYN suggested that the parietal pleura perhaps played a greater part in the formation of exudates than did the visceral pleura. Pleural symphysis in the absence of pleural effusion was commoner in the pneumoconioses than in other conditions. Dr JAMES CROCKET believed that pleural effusions were best treated by injecting air every fourteen days to maintain pressure and prevent adhesions. After aspiration he thought it important to wash out the pleural cavity with acriflavine, 1 in 2,000 to 1 in 5,000 solution.

In reply, Dr MISTAL explained that though he had devoted his lecture to the complications of thoracoscopy they were actually infrequent. He gave a series of statistics showing this and indicating how the majority of thorascopies were effected without incident.

Unilateral Pulmonary Tuberculosis

On June 11 Dr DE BLOEME of Laren, Holland, gave a paper on the treatment of unilateral pulmonary tuberculosis. He said that of 1,260 patients whose records he had analysed 12.6 per cent were admitted to his sanatorium for recent pleurisy with effusion, 52 per cent for bilateral pulmonary tuberculosis, 4.6 per cent for extrapulmonary conditions, and 22.1 per cent for unilateral pulmonary tuberculosis. Tubercle bacilli were found in the sputum in 59.5 per cent of these cases of unilateral pulmonary tuberculosis. All his patients were kept in bed until sputum tests had remained negative for a full three months. In the last five years he had seen 166 cases of unilateral pulmonary tuberculosis, of these, 101 were treated with collapse therapy. Sputum which had been positive changed to negative in 75 per cent of patients treated conservatively, and in 74 per cent of patients treated by collapse therapy. He believed that it should be possible to diagnose some 25 per cent of all cases of pulmonary tuberculosis in the unilateral stage of the disease. Dr De Bloeme showed some interesting analyses of the effects of varying forms of treatment. In all his cases the duration of treatment before working capacity was fully restored was as a rule from eighteen to twenty eight months. He then discussed a series of lantern slides of tables indicating the average periods of stay in hospital in cases with or without cavities, and treated either conservatively or by collapse therapy.

Dr FREDERICK HEAF, Dr EDWARDS and Dr FLETCHER took part in the discussion. Dr Edwards said that an experience of 1,300 phrenic evulsions had convinced him that this operation alone had no advantage over artificial pneumothorax, but when combined with pneumothorax it was of great value. Figures taken from 1,900 cases showed that of those who had had a complete artificial pneumothorax, 60 per cent were alive at the time of the follow-up study, whereas of those who had had in addition a phrenic evulsion 90 per cent were alive. Dr DE BLOEME replied briefly to the discussion, and in answer to a question said that there were at present 37,000 sanatorium beds in Holland.

The Tuberculosis Problem

Five speakers opened a most interesting debate on difficulties in dealing with the tuberculosis problem. Professor A RAMSBOTTOM speaking as a consulting physician, pointed out the importance of certain vague symptoms,

such as undue tiredness, anorexia and loss of weight. Dyspeptic symptoms might mask the real diagnosis. In the case of a patient who complained of spitting blood but had no definite signs, he made it a routine to ask if the blood was intimately mixed with the sputum, and if the patient had coughed and spat blood, this indicating a pulmonary origin, or if he had felt something welling up, in which case the nasopharynx was the probable source. The diagnosis once made, it was not difficult as a rule to persuade the patient to go to a sanatorium. He thought that acute lesions in the young always demanded sanatorium treatment whereas chronic lesions in the middle aged might often be treated effectively at home, by rest in bed. Another problem was presented by the patient who had just returned from a sanatorium and needed advice as to when he should start work. There was always a danger of converting a sick worker into a healthy loafer. Prognosis he thought, should always be influenced as much by the family history, the patient's temperament and habits and the conditions under which the disease was contracted as by the purely clinical findings.

Dr W F JACKSON said that he was a general practitioner working in an industrial region which was classed among the special areas. His main difficulties were those arising from the economic circumstances of his patients. One of his difficulties lay in persuading young people to go to a sanatorium for observation when they were in what might be described as the pre-clinical stage of tuberculosis. Another difficulty was that patients still disliked being notified as cases of tuberculosis. Many firms closed their doors to tuberculosis suspects, and patients knew that if they were notified as tuberculous their livelihood might be endangered. He thought it was still true to say that the working classes could not afford to be ill. The public did not realize how greatly the treatment and prognosis of tuberculosis had improved in recent years, and a great deal of educational work remained to be done. The majority of patients returned from sanatoria with their disease quiescent and they were often anxious to return to work. Unfortunately a too early return to the environment which had helped to produce their condition often resulted in prolonged invalidism. The dietary that these patients needed was often not available simply because they could not afford it.

He was often questioned by tuberculous patients as to whether they might marry, and if so whether they might procreate. The question was always difficult, because the answer to it was never appreciated by the patients, and no amount of advice seemed to diminish 'the second urge of those who live in already overcrowded and squalid areas'. He knew that the tuberculosis death rate was falling, but he was certain that the rate of invalidism was rising. A drastic rise in the standard of living of the poorer patients was necessary before tuberculosis could possibly be brought under control.

Dr A DOVE CORMAC, medical superintendent of a mental hospital, said that in the five years before the war the average tuberculosis fatality rate among his patients was 9.5 per 1,000. In the last five years it was 1.2 per 1,000, which compared favourably with the figure for the general population of 0.8 per 1,000. Mental patients either could not or would not co-operate, and so diagnosis was only possible by keeping regular records of weight and temperature and if any appreciable variation was noted examining the patients by x-rays and perhaps investigating the faeces for tubercle bacilli. Dr Dove Cormac then went on to give certain figures which bore out the criticisms he made of mental hospitals generally with regard to the poor dietary given to patients and the lack of laboratory facilities and of accommodation for the segregation and treatment of tuberculous mental patients.

Dr R E LANE spoke as medical officer to an industry which included both large and small factories. He said that the chief difficulties in dealing with tuberculosis were economic and environmental conditions which made patients reluctant to go for treatment, and perhaps even

more reluctant to complete it. The patient feared the possibility of losing his job, the sanatorium stigma and the sanatorium routine. Propaganda and education were much needed. When the patient had returned to work he must be given a real job and not a specially created one if a healthy independence and satisfaction with the work done was to be maintained. In the case of those patients who had returned from sanatoria there should be no shift work, no night work, and no overtime. A tuberculous patient needed subsidizing until he was completely rehabilitated. He thought that there should be a closer liaison between the tuberculosis services and industry. In this country it was the smaller firms who employed more than half the people engaged in industry, and since they had no medical officers, propaganda and the education of both employers and employees must come from the tuberculosis services.

Dr D. P. SUTHERLAND, speaking as a tuberculosis officer, said that a close knit organization, with one person in charge of all patients from the stage at which the diagnosis was made up to their return to work, was necessary. He believed that much of the fear of tuberculosis was due to a half knowledge fostered by the lay press. Increased institutional accommodation was vitally necessary in order to reduce the waiting lists. Knowledge that treatment would promptly follow would reduce appreciably delays in diagnosis and notification.

In the discussion on this subject Dr H. TRAYER, Dr DAY and Dr O. M. MISTAL took part.

The Tomograph

Dr J. B. McDougall pointed out that the bony structures of the thoracic cage had always made visualization of the lung difficult. Stereoscopic radiology had helped to resolve this difficulty but only to a limited degree. Tomography revealed with clarity lesions which even stereoscopically were difficult to define. The theory of tomography was simple. Both tube and film were moved about a fixed point. This movement blurred and effaced the layers above and below the fixed point and gave as it were a sectional radiograph. Unfortunately this simple technique was applicable only to small fields. For larger fields movement must be in two axes and therefore a complicated apparatus was necessary. The number of tomographs which might be taken was limited only by the depth of the patient's chest, but in actual practice three were usually sufficient. A ventral one was taken at a depth of 7 cm. from the front of the chest, a median one at the level of the hilum of the lung and a dorsal one at a depth of 7 cm. from the back of the chest. If additional ones were necessary then they were spaced at intervals of 2 cm. because the depth of the layer represented in the tomographs was about 2 cm. An exposure of one second gave optimum results with as a rule a 6 kW tube for frontal tomographs and a 10 kW tube for lateral tomographs. The thickness of the section represented varied inversely with the size of the arc of movement. Dr McDougall then showed a series of tomographs which revealed cavities and processes not shown on the straight antero-posterior radiograph and gave a very exact picture of the size and extent of systems of cavities. Dr McDougall concluded by saying that clinical experience of tomography was as yet very limited but at the moment tomography was of most value in cases of pulmonary tuberculosis. In reply to a brief discussion he explained that up to the present he had taken only some 400 tomographs of just over 100 patients. In 20 to 30 per cent of these cases the tomographic findings had made the surgeon hold his hand while otherwise he would have operated.

cases which might otherwise be regarded as hopeless. In mild cases a sanatorium regime often produced good results but where there was a cavity on one side, with pyrexia, an artificial pneumothorax should be induced. He thought that the time element was much more important in children since their powers of resistance were so much less than those of adults. Artificial pneumothorax should always be considered in epituberculous cases, though they usually did quite well without it. In cases with more extensive adhesions, however, a pneumothorax should be induced as soon as possible, delay of even a month might be disastrous. Most of the symptoms of pulmonary tuberculosis in children were due to toxæmia, and measures which would reduce that toxæmia were always justified. He usually treated the side with the most marked signs and often found that the opposite lung cleared up very quickly. It was essential to gain the child's confidence to carry out the operation in a familiar room rather than in a theatre, and to tell the child the truth and not delude him into thinking that the operation would not hurt at all. In from 30 to 40 per cent of the children he had treated an effusion developed. It was left alone unless it became very large. Experience seemed to show that a partial collapse and small refills were just as effective as a complete collapse maintained by large refills. He concluded by suggesting that in any case of pulmonary tuberculosis in a child artificial pneumothorax therapy should at least be considered. A lengthy discussion to which he replied, followed Dr Agassiz's paper. Finally, an enjoyable meeting concluded with the discussion of a series of problem cases which were described by Dr E. H. A. PASK and Dr G. JESSEL.

E. Karpelis (*Münch. med. Wschr.* April 2, 1937, p. 529) states that an increasing number of patients come to the Institute of Medical Cosmetics to have tattoo markings removed. These are deeply embedded in the skin. On microscopical examination the epidermis is seen to be free of particles of colour, which are visible in the deeper layers of the corium in the cellular tissue beneath the skin and in the neighbouring lymph glands. Superficial methods of treatment such as irritant plasters and ointments, re-tattooing with white enamel powder, ultra violet rays and decortication of the superficial skin layers are never successful. Agents in which dosage cannot be regulated such as carbon dioxide snow, electrolysis, scalding with steam, and chemical decorticants, are too variable in their action to be efficient and often do more harm than good. The author advocates excision as the method of choice. Small markings may be removed under local anaesthesia at one sitting, larger areas may be dealt with at several sittings, leaving a fine scar the origin of which cannot be suspected. In cases in which excision alone is impossible for cosmetic reasons it may be combined with one of the following methods. (1) With the help of the galvano-cautery the epidermis is removed, after which the colouring particles can be dealt with. It is advisable to go from 1 to 2 mm. beyond the actual outline of the picture in order to ensure success. (2) A rasp may be used to remove the superficial layers to the cutis propria. A sharp spoon similar to that used for chalazions or a small lancet can then dig out the pigment nodules enmeshed in the underlying cellular tissue. (3) Wederhake's method of undercutting the skin and pinning the flaps to a sterilized board and needling the pigment deposits through to the epithelial side is often advantageous. (4) The skin may be scarified and powdered potassium permanganate rubbed in. Both scarification and rubbing must be energetic and hæmorrhage must be dealt with. A dry dressing is applied and in ten to fourteen days the scab falls off. (5) Vario's method is useful in similar areas. A petroleum layer is made round the tattoo markings. The area is moistened with concentrated watery tannin solution and needled. A silver nitrate pencil is then used and the area covered with powdered tannin which finally goes black.

SATURDAY JUNE 19 1937

THE SECOND-BEST

Sir Kingsley Wood has earned and established a reputation as an energetic and efficient administrator. He can be relied upon always to stimulate and enlarge the activities of whatever Department of Government he may be in charge, and to secure for it a degree of public attention and appreciation which other Departments may either envy or desire to escape. In the extensive general review of the work of the Ministry of Health which he gave to the House of Commons last week—a report of this speech appears in our Parliamentary Notes—he almost overwhelmed his audience with a mass of facts and figures relative to the varied work of the Ministry, and undoubtedly produced an impression of progress in most directions which, though not escaping some shrewd criticisms, pleased the House as a whole. The Minister's sincere interest in the problems of his Department and his enthusiasm towards the accomplishment of its aims fully deserve the recognition they have received, but some disquieting features of recent health administration should not go unnoticed amidst the general applause. There is a proverb which tells us that "the good is the enemy of the best," and though, like most proverbs, it may have only a limited application, the truth it embodies may be of the most vital moment and is nowhere more likely to be so than in the sphere of health.

In regard to housing the figures given by Sir Kingsley Wood may be impressive, and they will be quoted with effect from political platforms to uncritical audiences, but it can scarcely be denied that the quality, in respect of both structure and arrangement of large numbers of the houses delivered is unsatisfactory: that far too few of them are available for letting to working-class families at rents within their means and that the amenities and even conveniences of life are lacking from most of the new building estates, which present but a drab prospect to inhabitants and onlookers alike. Slum clearance and mitigation of overcrowding may progress, but it is most disappointing that the Minister should have to say that "when the present programme has been carried out I hope we shall be able to improve the present overcrowding standard." This can only mean that he is at present content, or compelled to accept a standard which is in great need of improvement.

In other departments of the Ministry's work there have recently been clear indications of a self-congratulatory acquiescence in the second best, and this in matters in which the medical profession has very direct interest and has an abundant claim to express an authoritative opinion. In regard to maternity, piecemeal legislation and administrative action are still allowed to hold the field and methods which should be national and centrally directed are left to the discretion of a variety of local authorities, many of which may be unable or unwilling to implement them or may do so in undesirable fashion. A suggestion for the establishment of local lists of practitioners who may be called upon by midwives, on principles which will be resented and combated by the medical profession and which can produce only meagre effects, is apparently still being preferred to one offered by the profession itself which the experience of that profession shows will be much more efficient in providing the best service. In regard to ophthalmic benefit for insured persons, the Minister dis regarding the opinion of a Royal Commission and two Departmental Committees, has now officially established a method of recognizing medically unqualified persons as fit to deal with eye conditions, involving at least a 35 per cent risk of the most serious consequences to insured persons as a body whereas there was a professional machinery at his disposal free from that risk. With regard to national health insurance practice in general he has presented, by both written and verbal evidence, a picture of what he ostensibly regards as a high standard of practice to be accepted under that system, which the general body of practitioners can describe only as greatly understated, both in nature and in scope. Once more, if this ideal of the second-best is to be accepted as that which is expected and paid for, it is to be feared that in many cases it is what may be given, in spite of the fact that most medical practitioners are happily content to fulfil something more than their strict obligations.

In the course of his survey Sir Kingsley Wood said that "although we have the finest social services in the world they are not yet fully utilized," and announced a coming propaganda campaign directed towards their extended usage. The medical profession is not unsympathetic towards such a campaign—with some provisos. May it not be that among the reasons for this lack of full appreciation of what certain publicly provided clinics offer is the fact that these clinics sometimes give only the second best, and that, since as at present conducted some of them tend to cover a field alternatively provided for through the general practice—a discerning and independent "ic" "at matters prefer this

least as satisfactory? At all events it is to be hoped that in the coming campaign it will not be forgotten that in pursuit of the national health it is not less efficacious to urge the public to seek early and skilled advice through the practising doctor than to urge them to do this through the municipal or county clinic. The profession will agree with the Minister that "the fight for good health cannot be successfully conducted with a limited choice of weapons on a narrow front." The sentence with which he concluded his speech is not without significance in this direction to-day. "If possible," he said, "we must broaden our front and deal not only with the specific diseases of the individual, but with the wider conditions of environment and occupation of the people." It has long been supposed that if these two activities are to be contrasted it is the latter which is the primary and principal concern of the central government department and of the local authorities. To have it now presented to us as a sphere to which attention should be directed "if possible" is more than a little astonishing. A well arranged display of the second best may make a good show. It may even be worth while, and Sir Kingsley Wood can be relied upon to make it as good as possible, but it is a poor substitute for the best, especially when that best is now in many directions attainable and it is only too likely to hinder the early attainment of that best.

OVERDOSAGE WITH VITAMIN D

A recent paper by Steck and others from Chicago¹ throws further light on the effects of vitamin D overdosage. In it are summarized the effects of massive doses on sixty five dogs and 773 patients. The authors have been particularly interested in the use of massive doses of vitamin D in such conditions as hay fever and asthma and are at pains to answer the criticism that such doses are harmful. There is now no question that at a certain dosage even pure crystalline vitamin D is lethal to man and to animals. There seem to be differences between various species, the rat being highly resistant and the rabbit very susceptible to the toxic effects. It is suggested that man shows about the same degree of susceptibility as the dog. Between individual dogs there appeared to be wide variation in resistance to the toxic effects, but all the dogs apparently survived doses of 20,000 units per kilogramme indefinitely without recognizable intoxication. The death of a man is recorded which was undoubtedly the result of overdosage of a concentrated solution of purified ergosterol, a doctor administered to him 2,000,000 units daily for

eighteen days—that is, 18,000 units per kilogramme, or ten times what he had intended to take. Among the 773 subjects treated with massive doses twenty had received over 15,000 units per kilogramme, and in four of these there were some manifestations of toxicity. Of the large series treated with doses between 3,000 and 5,000 units per kilogramme 4.5 per cent showed symptoms of toxicity. Five cases are recorded in which symptoms followed doses of between 1,500 and 3,000 units per kilogramme, but the authors do not regard these five as true examples of vitamin D toxicity.

The commonest symptoms of overdosage in adults are polyuria, nausea, vomiting and loss of weight. Pathologically there is cell injury followed by deposition of calcium, the organ most seriously affected being the kidney. Although they recognize the severity of the toxic effects, Steck and his fellow-workers feel that, provided the patient is under observation and the vitamin is withdrawn or the dose reduced as soon as symptoms appear, the continuation of this treatment is justifiable. They contend that "the burden of proof now rests on those who maintain the undesirability of the use of this form of therapy." To those who believe that the first essential of any treatment is that it should do no harm this reasoning looks rather naïve. The evidence that massive doses of vitamin D are of any value in arthritis, asthma, or hay fever is so flimsy that the burden of proof would seem to rest on those who advocate so unphysiological a method of treatment. The occurrence of toxic symptoms with massive doses is, of course, no argument against the legitimate use of vitamin D along physiological lines. Unfortunately the margin between the therapeutic and the toxic dose in some infants is not very wide. This subject was discussed by L. J. Harris² a few years ago. He recommended as a prophylactic dose 250 to 500 units, increasing up to 1,500 units at 1 year, and thereafter 1,500 units a day. Since then two interesting cases have been reported, one by Thatcher³ in which the death of a child aged 11 months was thought to result from overdosage of vitamin D, and one by Moncrieff⁴ in which florid rickets developed in a child of 17 months who was presumed to have had an adequate intake of vitamin D. In neither instance, however, is it possible to assess from the data given just how many units of the vitamin had been administered. In Thatcher's case the maximum dose would appear to have been 600 units a day, but this had been administered throughout the summer and in addition to two treatments with a mercury vapour lamp. In

Monierieff's case, if the particulars given were correct, the child had been having close on 4,000 units daily. That both these cases are due to some unusual abnormality is indicated by the experience of Shelling and Hopper¹ in the treatment of several hundred patients over a period of six years. During this time they found that 1,125 international units of vitamin D daily in the form of viosterol was effective as a prophylactic dose for all full term infants. The only exceptions were premature, rapidly growing infants, to whom they considered it was advisable to give up to 4,500 units for the first four months of life, subsequently reducing the dose to 1,125 units. In the treatment of rickets they found that the optimum curative dose was 4,500 units per day, and that doses above this did not increase the rate of healing. Although in many cases they had prescribed up to 13,500 units daily they observed no cases of toxicity. Thatcher lays stress upon the fact that his patient had received vitamin D throughout the summer and had had two treatments with a mercury vapour lamp. There is no way of assessing the amount of vitamin D formed under the influence of sunlight, but the frequency of rickets in the sunny climate of Baltimore, where Shelling and Hopper did their work, suggests that it is not considerable. Their work would seem to go a long way towards establishing the optimum dose for children which should be at least 1,125 units and never more than 4,500 units. It is most desirable that all vitamin D preparations should be labelled and prescribed in terms of international units.

SURGICAL TREATMENT OF SCLERODERMIA

Within two years two new periodicals devoted to surgery have appeared: first, the *Journal of the International Society of Surgery* published in Brussels and now an American monthly with the title of *Surgery*. This journal is published at St. Louis and in a preface Dr W. J. Mayo states that in the great tract of country between the Rockies and the Alleghenies *Surgery* will become to some extent at least, the organ of clinical surgery of the Middle West and yet it will not be local in any respect, but an organ of the world's surgical thought. He believes that it will fulfil a useful purpose by stimulating the younger men to work. With these new journals two more conduits have been provided for the great flood of contributions to the science and art of surgery and while these will add to an outflow which already causes some concern to those who fish the reservoir or the channels which lead from it, time will show what kind of fish select these new channels and whether the channels themselves will open up and develop or become choked with weeds.

The first paper in the first (January) number of *Surgery* opens as follows: "The ideal and trend of modern surgery may be characterized by the continuous search for a more ratiocinative comprehension of the less obvious alterations in physiologic functions consequent to the more apparent anatomicopathologic processes." This is a formidable opening but it introduces an interesting paper from the clinic of Professor René Leriche at Strasbourg. The subject is the surgical treatment of scleroderma. Scleroderma is defined as a condition of sclerosis, induration and pigmentation of the skin which may be either localized or generalized, and may be associated with asthma, digestive disturbances, arthritis, muscle atrophy, or other symptoms. Because of the resemblance of certain cases in their initial stages to Raynaud's disease and the belief that vasomotor disturbances are important as an aetiological factor, sympathectomy has been tried for the condition. Since 1924 Leriche and his associates have operated upon thirteen cases which they report in detail. They consider that some degree of improvement followed the operation in approximately two thirds of their patients. The most suitable cases for sympathectomy are those which show pronounced vasospastic phenomena especially when these precede the cutaneous manifestations. In generalized advanced cases sympathectomy is of little or no avail. Leriche and his co-workers comment on a hypercalcaemia which they find in some cases and believe that parathyroid dysfunction is sometimes present. Scleroderma they believe, should be looked upon as a chronic disturbance of parathyroid function evolving over a long period of time so that when the patient is finally observed manifestations of hypercalcaemia may be absent. They claim that cutaneous changes clinically and histologically like those of scleroderma have been experimentally produced in rats by injections of parathyroid extract, and that in man osteoporosis is present in some cases, the hypotonia and asthma occasionally observed are also suggestive of disturbance in calcium metabolism and of hyperparathyroidism. Since 1931 thirteen cases of scleroderma have been submitted to parathyroidectomy by Leriche and his colleagues. They claim improvement in over 90 per cent. In certain cases sympathectomy and parathyroidectomy were combined. M. G. Jeanrenay² has reported to the Medical and Surgical Society of Bordeaux two cases of scleroderma in which he performed partial parathyroidectomy in January and August 1936 respectively. The first case showed only slight if any improvement but it was thought probable that it had been rendered stationary. Considerable improvement was claimed for the second case. Leriche and his co-workers conclude their paper by stating that the aetiology and pathogenesis of scleroderma are unknown but that up to the present non-surgical treatment has been of little or no avail. They regard it as unjustifiable to state definitely that scleroderma is caused by hyperparathyroidism but they believe that the evidence supports their contention that a chronic hyperparathyroidism is present in scleroderma and that parathyroidectomy ameliorates the condition. Sympathectomy may be combined with parathyroidectomy.

PRELIMINARY

Nomination of Dr S Watson Smith as a Vice-President

162 The Council recommends:

RESOLUTION That S Watson Smith M.D. F.R.C.P.(Ed.) (Bournemouth) be elected a Vice President of the Association under Article 46 and By Law 72 in recognition of the exceptional services rendered by him to the Association in the World Tour

Annual Meeting 1940

The Council has accepted the invitation of the British Medical Association to hold its Annual Meeting in London in 1940

The Medical Secretary's Visit to India

The Medical Secretary went to India in 1936 to study the medical practice and to report on the health of the Indian people. He found that the medical services in India were in a state of transition and that the Government were anxious to improve them.

development of the medical services of India. On his return he made a report to the Council which has been referred to a special committee for consideration. The Council is highly appreciative of the services rendered by Dr Anderson on its behalf both as regards his work in India and the report which he submitted on his return.

Association Office Arrangements

(Continuation of para 14 of Annual Report)

165 In view of the rapid increase in the volume of work of the Medical Department, and the still further expansion of that work arising from the action which will be necessitated in the recruitment of medical practitioners in the event of national emergency, to which reference is made in para 169 of this report the Council has decided that a layman of high educational standing be appointed to the staff of the Medical Department.

Consequent upon the reorganization of the Finance Department it has become necessary to create a new appointment in that department the duties of which will be mainly confined to the management of the Association's finances and the supervision of matters dealing with the Association's properties etc. The Council has therefore appointed a chief cashier.

Society for Cultural Relations between the Peoples of the British Commonwealth and the USSR

166 The Council has asked Dr N E Waterfield to represent the Association at a tour of the medical institutions of the U.S.S.R. which is being organized by the above Society

Obituary

167 The following is a supplementary list of Members whose deaths the Association has to deplore

Dr ERNEST BLAIR, Chairman and Representative, South Shields Division

Dr CECILE BOOYSEN, Representative St Paneras Division
Dr SARAH AILEEN FLORINCE, Boyd-Mackay Member of Executive Committee Hendon Division

Dr HARRY PRESCOT FAIRLIE, Secretary 1922 Vice President 1929, President 1931 Section of Anaesthetics

Dr JOSEPH GIUSANI, Member of Central Council and Irish Committee

Dr JOHN LUKE JACKSON, Secretary Section of Neurology and Psychological Medicine 1923

Professor EDGAR HARTLEY KITTLE, Vice-President 1925, President 1928 Section of Pathology and Bacteriology

Dr JOHN McDONALD, Chairman Stratford Division

Mr JOHN DAVID MALCOLM, Secretary Section of Obstetrics and Gynaecology 1900

Dr GEORGE PARKER, Member of Central Council Public Health and Hospitals Committees Representative Bristol Division

Dr HUGH THORNTON RYMER, President Natal Inland Branch

Dr WM HENRY SARRA, Chairman South Essex Division

Professor DAVID ALEXANDER STEWART, Vice President Section of Tuberculosis 1930

Colonel RUSSELL TRACY INGHIS, Chairman Auckland Division

Dr RICHARD WHITTINGTON, Chairman and Representative Brighton Division Vice President Section of Climatology and Balneology 1913

Honours

168 The Council has pleasure in announcing that since the publication of its Annual Report honours have been conferred upon the following and that the congratulations of the Association have been sent to the several recipients

BARONET

Sir Cuthbert Sidney Wallace, K.C.M.G., C.B., F.R.C.S., London

K.C.B.

Edward Mellanby, F.R.S., London

K.C.V.O.

Sir John Atkins K.C.M.G. London
George Frederic Still, London

K.B.E.

Air Vice Marshal Alfred William Iredell, C.B., K.H.P., London

KNIGHT BACHELOR

Arthur Edwin Horn, C.M.G., Oxted

Arthur Frederick Hurst, Ascol

Professor Harold Beckwith Whitehouse, Birmingham

C.B.

Surgeon Rear-Admiral Guy Leslie Buckeridge, O.B.E., K.H.S., Haslar

Major-General William Haywood Hamilton, C.I.E., C.B.E., D.S.O. K.H.P., Rawalpindi

Major General Osburne Ievers, D.S.O., K.H.S., Salisbury

Major-General Henry Marrian Joseph Perry, O.B.E., K.H.S., London

Air Commodore Albert Victor John Richardson, O.B.E., K.H.S., Uxbridge

C.M.G.

Robert Henry Hogg, O.B.E., Paraparaumu, New Zealand

C.I.E.

Lieut Colonel Ronald Herbert Candy, I.M.S., Poona

Ernest Muir, London

Recruitment of Medical Practitioners in the Event of National Emergency

169 With the approval of the Committee of Imperial Defence the Council has given authority for the use of the machinery of the Association for the purpose of establishing in the area of each Home Division registers of those practitioners who, in the event of emergency arising,

would be willing either (a) to accept commissioned medical service with the Forces abroad or at home, or (b) to offer their services for the treatment of air raid casualties either in their own areas or on a short term contract in any part of the country. The method by which these registers shall be instituted is under consideration.

Protection of Practices of Members Joining His Majesty's Forces

(Continuation of para 10 of Annual Report)

170 The Council has appointed a special Committee to prepare a memorandum on the principles which should guide practitioners in dealing with the patients of absentees and a communication on the subject will be issued in due course to Honorary Secretaries of Home Divisions.

ORGANIZATION

Visits to Divisions and Branches by Medical Secretaries

171 Excluding the tour of the Indian Branches made by the Medical Secretary during the past session forty eight visits to Divisions and Branches have been paid by the Medical Secretaries. Divisions and Branches are reminded that the Council is pleased to arrange for a member of the Medical Secretariat to visit a Division or Branch upon request.

MEDICAL ETHICS

Association Disciplinary Procedure

(Continuation of para 77 of Annual Report)

172 After careful consideration the Council has come to the conclusion that in the present circumstances it would be unwise to recommend any alteration of Articles 9 and 10 of the Association which permit of the expulsion of a member only upon the representation of a Division or Branch. The Council has decided however that systematic action should be taken to remind Divisions of their powers in every case where a member has either applied for or accepted an appointment the terms and conditions of which are contrary to the Memorandum of Recommendations and especially of their power to refer cases to the Central Ethical Committee without prior detailed consideration irrespective of whether the Division has adopted a binding resolution.

Furthermore when an Important Notice in relation to a public health appointment is published in the *British Medical Journal* the Division concerned will be immediately notified and reminded of its power to inquire into the conduct of any member of the Division who may apply for the appointment.

Non Medical Radiologists

173 The Council has considered the ethical aspect of the employment by medical practitioners of non medical radiologists and has expressed its general sympathy with the views of the Council on the subject. It has also expressed its sympathy with the views of the Council on the subject of the employment of non medical radiologists. The Council has decided to establish an ethical committee to consider the employment of non medical radiologists.

SUBSCRIPTIONS

whose schemes have been approved by the Council for the inclusion of subscribers whose income exceeds £250 p.a.

and has prepared a model scheme for the provision of medical attendance and treatment upon persons of moderate incomes above the National Health Insurance limits. This model scheme is reprinted in Appendix V.

The scheme embodies the essential principles contained in the Association's model scheme for a Public Medical Service but the Council draws particular attention (i) to Rules 22 and 23 which define the content of medical service to be provided under this scheme and (ii) to the footnote to Rule 18 dealing with the question of subscriptions.

Fees for Medical Witnesses in Criminal Cases

175 The Council submits in Appendix VI a statement which it has forwarded to the Home Secretary for a general increase in the fees payable to medical witnesses in criminal cases.

Medical Examination in Compensation Cases

176 The Council's attention has been drawn to the action of certain firms of solicitors in engaging to represent the patient at medical examination for compensation purposes by a practitioner other than the patient's own doctor.

The Council has approached the Accident Offices Association in the matter and has suggested that it is in the interests both of the patient and of the insurance company that the patient's own doctor should be present with the insurance company's doctor when the latter conducts his examination.

Investigation of Deaths from Cancer

(Continuation of para 86 of Annual Report)

177 A reply has now been received from the Ministry of Health stating (i) that experience has shown that practitioners have willingly co-operated with medical officers of health in the collection of the information desired and consequently that it did not appear that the Minister was called upon to take any action on the question of payment of fees by local authorities and (ii) that the form in use for the purposes of the scheme was worded in such a way that the patient's name need not be divulged if the practitioner thought it undesirable and further that the question of whether or not the patient's relatives might object to the information being given was one for the practitioner concerned rather than for the medical officer of health.

Land Settlement Association

178 The Council is discussing with the central office of the Land Settlement Association the fees to be paid for contract medical attendance on settlers and their families.

Public Medical Services

(Continuation of para 80 of Annual Report)

179 The Council has made certain amendments to the Model Rules for Public Medical Services and has revised the Association's Memorandum on the Establishment and Development of Public Medical Services. These two documents have now been embodied in an Association Green Book copies of which may be obtained from the Medical Secretary.

Provident Schemes and Payment to General Practitioners for Treatment

Society for Cultural Relations between the Peoples of the British Commonwealth and the USSR

166 The Council has asked Dr N E Waterfield to represent the Association at a tour of the medical institutions of the USSR which is being organized by the above Society

Obituary

167 The following is a supplementary list of Members whose deaths the Association has to deplore

Dr ERNEST BLAIR Chairman and Representative, South Shields Division

Dr ERIC BOOSEN Representative St Pancras Division
Dr SARAH AILEEN FLORINCE BOYD-MACKAY Member of Executive Committee Hendon Division

Dr HARRY PRESCOTT FAIRLIE Secretary 1922 Vice President 1929, President 1931 Section of Anaesthetics

Dr JOSEPH GIUSANI Member of Central Council and Irish Committee

Dr JOHN LUKE JACKSON Secretary Section of Neurology and Psychological Medicine 1923

Professor EDGAR HARTLEY KITTLE Vice President 1925

President 1928 Section of Pathology and Bacteriology
Dr JOHN McDONALD Chairman Salford Division

Mr JOHN DAVID MALCOLM Secretary Section of Obstetrics and Gynaecology 1900

Dr GEORGE PARKER Member of Central Council Public Health and Hospitals Committees Representative Bristol Division

Dr HUGH THORNTON RYMER President Natal Inland Branch

Dr WM HENRY SARRA Chairman South Essex Division
Professor DAVID ALEXANDER STUART Vice President

Section of Tuberculosis 1930

Recruitment of Medical Practitioners in the Event of National Emergency

169 With the approval of the Committee of Imperial Defence the Council has given authority for the use of the machinery of the Association for the purpose of establishing in the area of each Home Division registers of those practitioners who, in the event of emergency arising,

would be willing either (a) to accept commissioned medical service with the Forces abroad or at home or (b) to offer their services for the treatment of air raid casualties either in their own areas or on a short term contract, in any part of the country. The method by which these registers shall be instituted is under consideration.

Protection of Practices of Members Joining His Majesty's Forces

(Continuation of para 10 of Annual Report)

170 The Council has appointed a special Committee to prepare a memorandum on the principles which should guide practitioners in dealing with the patients of absentees, and a communication on the subject will be issued in due course to Honorary Secretaries of Home Divisions.

ORGANIZATION

Visits to Divisions and Branches by Medical Secretaries

171 Excluding the tour of the Indian Branches made by the Medical Secretary during the past session forty-eight visits to Divisions and Branches have been paid by the Medical Secretaries. Divisions and Branches are reminded that the Council is pleased to arrange for a member of the Medical Secretariat to visit a Division or Branch upon request.

MEDICAL ETHICS

Association Disciplinary Procedure

(Continuation of para 77 of Annual Report)

172 After careful consideration, the Council has come to the conclusion that, in the present circumstances, it would be unwise to recommend any alteration of Articles 9 and 10 of the Association which permit of the expulsion of a member only upon the representation of a Division or Branch. The Council has decided however that systematic action should be taken to remind Divisions of their powers in every case where a member has either applied for or accepted an appointment the terms and conditions of which are contrary to the Memorandum of Recommendations and especially of their power to refer cases to the Central Ethical Committee without prior detailed consideration irrespective of whether the Division has adopted a binding resolution.

Furthermore when an Important Notice in relation to a public health appointment is published in the *British Medical Journal* the Division concerned will be immediately notified and reminded of its power to inquire into the conduct of any member of the Division who may apply for the appointment.

Non Medical Radiologists

173 The Council has considered the ethical aspect of the employment by medical practitioners of non medical radiologists and while it is in general sympathy with the view that for radiological purposes medical practitioners should consult medically qualified radiologists the Council does not consider it possible at present to establish an ethical standard which would prohibit the employment by medical practitioners of non medical radiologists.

MEDICO POLITICAL

Scheme for the Provision of Medical Attendance and Treatment upon Persons of Moderate Incomes above the National Health Insurance Limits

174 The Council has considered the following Minute 84 of the A.R.M., 1936

Minute 84—Resolved That (with reference to para 74 of Annual Report of Council) the Council be instructed to consider the advisability of revising its Model Scheme for Public Medical Services so as to provide in areas

whose schemes have been approved by the Council for the inclusion of subscribers whose income exceeds £250 p.a.

and has prepared a model scheme for the provision of medical attendance and treatment upon persons of moderate incomes above the National Health Insurance limits. This model scheme is reprinted in Appendix V.

The scheme embodies the essential principles contained in the Association's model scheme for a Public Medical Service but the Council draws particular attention (i) to Rules 22 and 23 which define the content of medical service to be provided under this scheme and (ii) to the footnote to Rule 18 dealing with the question of subscriptions.

Fees for Medical Witnesses in Criminal Cases

175 The Council submits in Appendix VI a statement which it has forwarded to the Home Secretary for a general increase in the fees payable to medical witnesses in criminal cases.

Medical Examination in Compensation Cases

176 The Council's attention has been drawn to the action of certain firms of solicitors in engaging to represent the patient at medical examination for compensation purposes a practitioner other than the patient's own doctor.

The Council has approached the Accident Offices Association in the matter and has suggested that it is in the interests both of the patient and of the insurance company that the patient's own doctor should be present with the insurance company's doctor when the latter conducts his examination.

Investigation of Deaths from Cancer

(Continuation of para 86 of Annual Report)

177 A reply has now been received from the Ministry of Health stating (i) that experience has shown that practitioners have willingly co-operated with medical officers of health in the collection of the information desired, and consequently that it did not appear that the Minister was called upon to take any action on the question of payment of fees by local authorities and (ii) that the form in use for the purposes of the scheme was worded in such a way that the patient's name need not be divulged if the practitioner thought it undesirable, and further that the question of whether or not the patient's relatives might object to the information being given was one for the practitioner concerned rather than for the medical officer of health.

Land Settlement Association

178 The Council is discussing with the central office of the Land Settlement Association the fees to be paid for contract medical attendance on settlers and their families.

Public Medical Services

(Continuation of para 80 of Annual Report)

179 The Council has made certain amendments to the Model Rules for Public Medical Services and has revised the Association's Memorandum on the Establishment and Development of Public Medical Services. These two documents have now been embodied in an Association Grey Book, copies of which may be obtained from the Medical Secretary.

Provident Schemes and Payment to General Practitioners for Treatment

180 The Council has considered the following Minutes 145, 146 and 147 of the A.R.M. 1936 and has obtained

information from insurance companies and other bodies interested in schemes of this nature

Minute 145—Proposed by Torquay (E Ward) That (with reference to Sections 5, 6 and 7 of para 127 of Annual Report of Council) in the opinion of the Representative Body the need for a scheme of insurance against the expense of medical and nursing services during illness has now become urgent. Such a scheme should be of uniform application throughout the country, and should be organized and developed by a competent business authority with full knowledge of insurance finance who alone will be concerned with the method of introducing it to the public. Believing that the medical profession should not be involved in financial negotiations with provident associations it is suggested that such schemes should be in the form of a contract between patient and insurance company only. The aim of this resolution is to organize and develop a scheme for persons of the middle and professional classes on a mutual insurance basis and in return for a definite premium to offer financial assistance in respect of (a) the costs of institutional accommodation in private beds attached to voluntary or council hospitals or in beds in nursing homes the cost of all nursing use of operation theatre x-ray plant, laboratory and other ordinary institutional equipment and (b) the cost of general practitioner and associated professional services. In view of the urgency of the matter steps be taken to implement this resolution forthwith.

Minute 146—Whereupon an amendment by F. A. Roper (Exeter) seconded by N. E. Watersfield (Kingston on Thames)

That (with reference to para 127 of Annual Report of Council) it be an instruction to the Council to explore further the problem of insurance of this economic class in respect of all illnesses whether treated institutionally or at home with the object of producing if possible a scheme whereby such a service may become available as a benefit additional to those provided by the existing Provident Schemes for middle-class patients.

Minute 147—After discussion it was

Resolved That the matter be referred to the Council for consideration.

It appears that an insurance scheme which will allow of payments to general practitioners may be practicable, and the Council is investigating the matter further.

Parliamentary Agent to the Association

181 While a careful scrutiny is at present conducted of all those Bills introduced into both Houses of Parliament which may affect the profession, the Council has come to the conclusion that it will be more effective if this work is placed in the hands of an Agent who specializes in such work.

The Council has therefore decided to employ a Parliamentary Agent to examine all Bills, public and private, Provisional Orders, etc., introduced into Parliament, and to bring to the Association's notice any proposals affecting or likely to affect, the interests of the medical profession.

HOSPITALS

Voluntary Hospitals Commission

182 The Council has considered the Report of the Voluntary Hospitals Commission appointed by the British Hospitals Association in June 1935. The most important recommendations of the report are designed to remedy the defects of the existing system in relation to co-operation and co-ordination. For this purpose the division of the country into hospital regions and the formation in each region of a voluntary hospitals regional council to correlate the hospital work and needs in the area is urged, followed by the establishment of a central council to co-ordinate the work of the regional councils. The grading of hospitals into central, district, and cottage hospitals is recommended and the relationship between voluntary and council hospitals is discussed. The section of the

report which deals with the scope and conduct of the out-patient department is an almost complete endorsement of the Association's policy, the only exception concerns the provision of treatment for dependants of the lower waged insured persons. The principle of payment of the visiting medical staff is approved subject to certain reservations and it is urged that the advice of appropriate experts should be available in making appointments to the visiting medical staff. Contributory schemes and provident schemes are welcomed, and the provision of pay beds for patients of all classes is recommended. Other sections of the report deal with finance, publicity methods, accommodation, administration, nursing, ambulance, and auxiliary services, patients' records, and the special position of teaching hospitals.

The Council is glad to note that the report of the Commission embodies a fairly general endorsement of the Association's Hospital Policy.

Payment of Medical Staffs of Voluntary Hospitals

183 In its Hospital Policy the Association urges that in respect to the treatment given to contributing patients, "medical staffs of voluntary hospitals shall receive from the hospital managers remuneration for such service either by salary by payment for definite services and responsibility by honorarium or by agreed payments to a staff fund placed at their disposal. This policy was endorsed in 1932 by the Joint Committee of the British Hospitals Association and the British Medical Association presided over by Lord Linlithgow. It has again been endorsed in the recently published report of the Voluntary Hospitals Commission which states: 'We are of opinion that the general principle of the payment of medical and surgical staffs of voluntary hospitals should be approved and that its application should be considered without delay by hospitals Boards of Management.'

In view of this position, the Council has taken steps to urge the committees of management of voluntary hospitals to give early consideration to the application of the recommendation of the Joint Committee of the British Hospitals Association and of the British Medical Association presided over by Lord Linlithgow "that the time has come to recognize the claim of the visiting medical staffs to some share in the moneys raised for the treatment of patients in hospital other than those provided by voluntary subscription or donation for the treatment of free patients" as endorsed in Chapter XI (paras 146-51) of the Report of the Voluntary Hospitals Commission.

Ophthalmic Examinations at Hospital Out-patient Departments

184 The Council has considered the desirability of some action being taken to secure the diversion from the out-patient departments of eye hospitals and general hospitals of insured persons entitled to ophthalmic benefit under the National Health Insurance Acts, whether members of contributory schemes or otherwise. In the first instance the co-operation of the British Hospitals Association and the appropriate ophthalmological societies has been invited with a view to the subsequent issue of a communication on this subject to governing bodies and medical staffs of hospitals.

PUBLIC HEALTH

1923 Agreement between Association and Society of Medical Officers of Health

185 A conference has been held between representatives of the Association and the Society of Medical Officers of Health to consider the terms of the 1923 agreement for co-operation between the two bodies, in the light of experience gained during the past few years. Consideration has been given to the desirability of improving the

existing machinery with regard to matters which necessitate prompt action by either the Association or the Society. The discussions with the Society are still proceeding.

Ministry of Health Circular 1550 Children under School Age (Continuation of paragraph 105 of Annual Report)

186 The Council has considered an inquiry as to whether the Association is in general agreement with the recommendation of the Ministry in Circular 1550 that children between 2 and 5 years of age should be admissible to minor ailment clinics provided by local education authorities. The Council sees no objection to this proposal provided the Association's existing policy is observed with regard to the conduct and scope of such clinics but the provision of minor ailment clinics should be unnecessary in areas where there is a Public Medical Service.

Senior Assistant Medical Officers

187 The Council has considered the question as to whether advertisements for senior assistant medical officers should be accepted for publication in the *B.M.J.* at the salary scale prescribed for officers employed in departments by Section II of the Memorandum of Recommendations (namely, £500 to £700 per annum). The Council has decided that advertisements for medical officers employed in departments in which the posts are described as those of senior assistant medical officers be not accepted unless the commencing salary is above the minimum of the scale.

Maternal Mortality

(Continuation of Addendum to Annual Report of Council *B.M.J.* Supplement May 8 1937)

188 On May 7 the Minister issued Circular 1622 to maternity and child welfare authorities requesting each authority to give early consideration to the Maternal Mortality Report and its recommendations and to inform him of the action they proposed to take. The Council has arranged for Divisions and Branches to be circularized (1) drawing attention to the Association's policy on the question of a selected panel of practitioners to answer midwives calls—namely that selection by any method other than that of self selection is not approved by the Association (2) urging active opposition to any proposal which does not conform with this policy and (3) pointing out that effect cannot be given to Recommendation 2 of the Report on Maternal Mortality until the rules of the Central Midwives Board have been altered.

Fees for Medical Practitioners Called in by Midwives

(Continuation of paragraph 106 of Annual Report)

189 A reply has been received from the Ministry of Health stating that the modifications suggested by the Association to the scale of fees for medical practitioners called in by midwives have been forwarded to the County Councils Association, the Association of Municipal Corporations and the London County Council for their observations.

With regard to the question of the effect of nomination of a practitioner upon the liability of the local supervising authority to pay fees the Ministry state

“under the rules of the Central Midwives Board a midwife is required in the case of any emergency as defined in the rules to call in when possible the doctor desired by the patient or by the responsible representative of the family. The Minister is advised that if that rule is observed the fact that the doctor called in has examined the patient ante-natally and has intimated to the midwife that he is willing to attend the patient should some complication make it necessary would not preclude the payment by the local supervising authority of a fee to the doctor in accordance with the scale prescribed by the Medical Practitioners (Fees) Regulations 1936.”

The Association's modifications to the scale were framed before the Report on Maternal Mortality was published.

The attention of the Ministry has been drawn to this and also to the fact that revision of the Association's scale of fees may be necessary in the light of any change which may be made in the method of utilizing the services of medical practitioners in midwives emergencies.

Public Health Appointments

190 From June 14 1936, to June 12 1937, 436 appointments, under the Memorandum of Recommendations (and Scottish Scale) as to Salaries of Whole-time Public Health Medical Officers were dealt with. In 422 of these instances the appropriate salary was either offered in the first instance or secured after negotiation.

Superannuation

191 The Council has considered the Local Government Superannuation Bill, the principal object of which is to ensure that provision should be made by all local authorities for the superannuation of their whole time officers. In the opinion of Council Clause 16 of the Bill, which provides for the compulsory retirement of female nurses, midwives, and health visitors at 60 years of age affords a suitable opportunity for urging the principles of ‘added years’ and interchangeability of superannuation service as between voluntary and council hospitals, and appropriate steps are being taken. If the principle of ‘added years’ is secured for nurses it will be a step towards its application to the medical profession.

Supervision of Midwives

192 The Midwives (Qualifications of Supervisors) Regulations, 1937 were issued by the Ministry of Health in May 1937. Article 3 of the Regulations requires *inter alia* that a medical supervisor shall be a registered medical practitioner who has had at least three years experience in the practice of his profession and who is registered in the *Medical Register* as the holder of a diploma in sanitary science, public health or State medicine. The Council has informed the Ministry (1) that the Association regrets that its opinion was not sought on the Midwives (Qualifications of Supervisors) Regulations, 1937, (2) that the qualifications prescribed by Article 3 of the Regulations will in effect prevent a local authority from appointing a highly qualified obstetrician as medical supervisor as it is unlikely that a specialist in this branch of medical practice will hold a diploma in public health.

Maternity Services (Scotland) Act, 1937

193 The principal object of this Act is to improve the standard of domiciliary midwifery by the provision of adequate medical and nursing services for women confined in their own homes. It differs from the Midwives Act in England inasmuch as every local authority is required subject to the approval of the Department of Health for Scotland to ensure that there shall be available not only an adequate domiciliary midwifery service but facilities for medical examination and treatment before during and after childbirth, together with the services of an anaesthetist and an obstetrician when required by the medical practitioner in attendance. The Act also provides for compensation to midwives ceasing or required to cease practice by reason of age or infirmity, the prohibition of unqualified persons acting as maternity nurses for gain, the attendance of midwives at post-certificate courses of instruction and the recovery or remission of fees in respect of the services provided.

HEALTH SERVICES

Interim Report upon Report of Scottish Departmental Committee on Health Services

194 The Council has considered three important and associated matters.

- (1) The Report of the Departmental Committee on Scottish Health Services and its reactions on Association policy.
- (2) The taking of more active steps towards implementing

the Association's proposals for a General Medical Service for the Nation

- (3) The making of representations to the Ministry of Health on the subject of the utilization of private practitioners rather than of salaried medical officers in all public clinical work.

Not unexpectedly, the Council has found itself unable to complete its reference in time to report for the Annual Representative Meeting, 1937, but it has carefully considered each chapter of the Scottish Report with the relevant recommendations and submits a memorandum (Appendix VII) commenting in detail on the most important of the findings in reference to the matters with which the Association is particularly concerned.

The Council has had the advantage of receiving the views of the Scottish Committee of the Association on the Departmental Report, but the point of view from which the Council has approached the consideration of the matter is not identical with that of the Scottish Committee. It has not been so much concerned with the suitability of the Departmental Committee's proposals to Scotland or the method of implementing them in conditions which are peculiar to Scotland as with their relationship to the general health policy of the Association—as to how far for example, they support or are contrary to, or differ from that policy, or whether they should lead to any reconsideration or modification of that policy. The memorandum which the Council submits indicates such points as these in reference to the several sections of the Departmental Report, but, lest they should be insufficiently appreciated in the consideration of these detailed comments the Council desires to emphasize two things which it considers of the greatest importance.

The first of these is that the Departmental Report as a whole is a most thorough and authoritative endorsement of the Association's health policy. There is nothing in the Report which contradicts that policy; there is little that falls short of that policy, and the arguments supporting the several recommendations are set forth in such a manner as to constitute a very powerful reinforcement of that policy by a specially selected body of experts, both lay and medical.

The second matter to which the Council wishes to draw special attention is that the Report raises in a very direct form the question of the future position of consultants and specialists and their relationship on the one hand to the general practitioners and on the other hand to clinics or treatment centres established by local health authorities in any organized medical service. There is no clear pronouncement on this question in the Association's policy, and in the opinion of the Council it constitutes one of the major matters on which it is necessary that the Council should formulate and recommend a policy to the Representative Body at its meeting in 1938.

MEDICAL BENEVOLENCE

195 The following statement shows the amounts collected and distributed through the Association's Charities Trust Fund during 1936

	Specially Earmarked	Allocated by Council
	£ s. d.	£ s. d.
Royal Medical Benevolent Fund	2,148 19 4	1,679 15 4 (£106 being earmarked for R M B F Guild)
Epsom College	1,038 13 11	793 15 4 (£78 being earmarked for Sherman Bigg Fund)
R M B F Society of Ireland	36 0 9	—
Sir Charles Hastings Fund	—	—
	<u>3,223 14 0</u>	<u>2,473 10 8</u>

The comparative figures for 1935 are

	£ s. d.	£ s. d.
R M B F	2,059 17 6	1,596 14 6
Epsom College	1,074 7 6	798 7 4
R M B F Society of Ireland	31 18 0	—
Sir Charles Hastings Fund	—	145 13 2
	<u>3,166 3 0</u>	<u>2,540 15 0</u>

The Council has had prepared a summary of the contributions to medical charities during 1936, and this is being issued to Representatives and to the Divisions. This document discloses the following facts:

	1934	1935	1936
Total number of practitioners in England, Scotland and Wales	40,384	41,360	41,971
Total subscribing to medical charities in their individual capacities (excluding those subscribing through Panel Committees)	9,013	10,348	9,992
	<u>22.31%</u>	<u>25.01%</u>	<u>23.81%</u>

The following areas are deserving of special mention for their contributions to medical charities:

Ashton under Lyne	Holland
Barnet	Huddersfield
Bedfordshire	Inverness
Blyth	Isle of Ely
Bolton	Isle of Man
Bournemouth	Kesteven
Bradford	Leicester and Rutland
Bristol	Marylebone
Buckinghamshire	Morpeth
Buxton	Northamptonshire
Cambes and Hunts	N. Glam. and Brecknock
Cardiff	Norwich
Chester	Oxford
Chesterfield	Preston

During the year 1936 the Association collected on behalf of the Charities £9 less than in 1935. The deficit may appear small, but it is disappointing not to be able to record an increase, especially in view of the fact that 1935 itself showed a fall compared with 1934. Both the R M B F and Epsom College have during the year made some progress with the adoption by their subscribers of the seven year covenant plan, but there is still only a small minority in the profession who take advantage of the concessions granted by the Finance Act of 1922. The advantages offered ought to be much more widely known than seems to be the case. Briefly, the State undertakes that whenever anyone covenants with a recognized charity to subscribe for seven years (or until his death, whichever is the shorter period), it will forgo income tax from the gross sum that is involved. To take a concrete case, let it be assumed that a subscriber earns a sum of 28s, that the State has already taken 7s of this as income tax at 5s in the pound, and that the remaining 21s is given to a charity under a deed of covenant. In these circumstances the State then refunds to the charity the 7s which it has received, so that the latter benefits in all by the whole 28s originally earned by the subscriber. Not only so, but the whole 28s.

is exempt from supertax, should the subscriber be liable to it. It should be added that such a covenant does not bind the executors of the subscriber, if he dies during the seven-year period. The covenant is, nominally, enforceable at law, but obviously no charity benefiting by such an arrangement would dream of enforcing its legal rights if the covenant should fall into arrears with his subscription.

196 During the year the Council received a request that it should found and endow at some approved Roman Catholic school a scholarship for medical orphans whose parents were members of the Roman Catholic Church. The Council did not accede to the proposal.

197 Much attention has been given to suggestions for arresting the fall in the amounts which the Association is able to collect annually. It would seem that there is still a large section of the profession which does not recognize any duty to subscribe regularly to the Medical Charities. Experience has shown that usually the best results are obtained when an enthusiastic member of a Division or Branch undertakes the responsibility of collecting subscriptions from his local colleagues, and the Council would, once again emphasize the desirability of appointing annually suitable members to the post of Charities Secretary.

198 A legacy of £50 to the Association on behalf of its charities was intimated during the year by the executors of Dr I. M. M. Aitken, whose name has been inscribed among the benefactors of the Association. The Council has directed that this legacy, when received, shall be invested to augment the capital of the Sir Charles Hastings Fund. It appeals to the profession for further benevolences of the like nature.

OVERSEA BRANCHES

Work of the Branches of the Association Over-seas

199 The reports of the Federal Council and the Overseas Branches and Divisions show that the interests of members in the Dominions and Colonies continue to be carefully watched. Some illustrative notes on the important and extensive work, scientific, medico-political, and social, of the Association over seas are given below.

AUSTRALIA

200 The Federal Council of the B.M.A. in Australia met in August 1936, and January 1937. The questions of organization discussed at the meetings included the formation of special groups within the Association for members having distinctive professional interests. The secretariat has been rearranged in order to allow Dr Hunter, who is Medical Secretary to the New South Wales Branch as well as General Secretary to the Federal Council, to devote more time to organization work for Australia as a whole.

The Commonwealth Government has established a National Health and Medical Research Council. While the Federal Council considers that the Medical Research Council should be a separate body, it has expressed to the Government its willingness to co-operate with the new organization and has accepted the invitation to nominate a representative on it. National Health Insurance is occupying a considerable amount of the attention of the profession in Australia and New Zealand and the Federal Council of Australia has deemed it advisable to enunciate certain general principles in anticipation of a State or Commonwealth Medical Service. These principles, which were adopted on the motion of the Queensland Branch, include the establishment of an income limit, the representation of the profession in the administration of the scheme, free choice of doctor, payment of general practitioners by capitation fees, and the disciplinary control by the organized medical profession of the doctors taking part in the scheme. The recommendations have been sent to the Prime Minister and the Premiers of the different States. Amongst other questions which the Council has considered during the year are the desirability of uniform medical registration throughout the Commonwealth, reci-

procity between State hospitals in the different States, and precautionary measures against gas attacks in warfare.

The fifth Australasian Medical Congress is to be held at Adelaide in August, 1937, and on that occasion the Federal Council will present the Gold Medal of the Association in Australia to Sir Henry Newland in recognition of his many years of devoted service.

The New South Wales Branch places on record its appreciation of the valuable services rendered to the Association by Dr J. A. Dick, who retired from the Council in March, 1936. Dr Dick, who was elected a Vice-President at the last Annual Meeting, was President in 1910-11, a member of the Council for thirty-four years, Honorary Librarian for thirty years, and representative on the Federal Council for fifteen years. The Branch has been very active in its medico-political work during the year. The representations which were made to the Minister for Health in support of the proposal of the Director-General for Health for the immunization of children against diphtheria have resulted in the establishment of a State wide scheme, in which the Department of Health, local authorities, and the members of the medical profession are co-operating. In view of the increasing interest in National Health Insurance the Branch sent its secretary, Dr Hunter, to Great Britain to study the subject there and it is hoped that the information he has obtained will be of great assistance to the profession throughout Australia when National Health Insurance becomes a matter of practical politics. The Branch has also had the advantage of an interview with Sir Walter Kinnear of the Ministry of Health for England and Wales during his visit to the Commonwealth Government. The Annual Meeting of delegates of the local associations affiliated with the New South Wales Branch was held in October 1936. Friendly society lodge practice occupied a prominent place in the proceedings, the questions discussed including income limits, choice of doctor, special medical services, fees for immunization against diphtheria and the sale and transfer of lodge practices. The recent establishment of base hospitals was discussed in its relation to the classification of hospital staffs and its effect on medical practice. Various questions concerning Workmen's Compensation were also on the agenda.

Lodge practice is an important feature in the work of all the Australian Branches and the Victorian Branch has just established a standing Consultative Committee of representatives of friendly societies and of the Branch. All matters affecting lodge practice in the area of the Branch will be referred to this Committee. The Branch has given approval to the Articles of Association of the Medical Eye Service of Victoria, which was started on July 1, 1936. It is hoped that the new facilities will enable many patients who have hitherto attended public hospitals to make provision for themselves instead of depending upon charity. At the request of the Public Medical Officers Association the Branch has prepared a classification and schedule of salaries for public medical-officers and it proposes to submit its suggestions to the Government. Hospital organization has presented many problems, and some of them such as the exploitation of out-patient departments and the treatment in charitable institutions of patients for whom the Government should be financially responsible show an interesting similarity to the hospital problems in Great Britain. The Branch has made arrangements to erect in its House of Honours boards bearing the names of past presidents and during the year it has dedicated a brass tablet to the memory of George Bass, surgeon to H.M.S. *Reliance*. An effort to promote still further the usefulness of the Branch library has been made by the preparation of a catalogue which is being printed and issued to members and the result is already noticeable in the increased number of books borrowed and in the attendances.

The Queensland Branch records its appreciation of the services of Dr W. N. Robertson, who has recently retired.

from active membership of the Branch Council Dr Robertson has been President of the Branch on four occasions and the Honorary Secretary's report states that 'it is impossible to estimate what the Branch really owes to him'. The work of the Branch during the year has been extensive and very varied. Further steps have been taken to promote the Branch's policy for a general medical service in Queensland. Approval has been given to the principle of making the aims and objects of the Branch known through the public press and of educating the public on health matters, and certain rules have been prepared for the guidance of the Publicity Subcommittee. In pursuance of this policy a statement on diphtheria immunization was published last year in the Press throughout Queensland, and it was also broadcast. In January, 1937, a Nutrition Research Committee was appointed. This Committee has prepared and published in the *Courier Mail* a special nutrition supplement and it has issued to members for distribution to their patients a circular on nutrition during pregnancy and nursing. The Branch is represented on a committee appointed to investigate the question of ophthalmia neonatorum in Queensland and it has offered its assistance in circularizing members and in urging the necessity of the wider use of preventive measures.

NEW ZEALAND

201 The subject of National Health Insurance appears to have overshadowed all others in New Zealand during the past year. The chairman of the Health Insurance Committee, Dr J. P. S. Jamieson has visited and addressed almost all the Divisions and has also met individual medical men who are practising in isolated parts of the country, and have therefore little opportunity for discussion with their colleagues. The Branch is looking forward to the visit of Sir Henry Brackenbury, the representative of the parent Association, who will be able to give it the benefit of his experience of National Health Insurance in Great Britain. At the conclusion of the work of preparation the representatives of the Committee will give oral evidence before the Parliamentary Committee. The Branch will have the satisfaction of knowing that its evidence will be truly representative of the profession in New Zealand, for of the 1,012 medical men in active practice more than 900 are members of the Association. The Branch Council has under consideration the rebuilding of its headquarters. It hopes eventually to have a building worthy of the profession and of the Association, with adequate office accommodation, a lecture theatre, and a library.

Fiji

202 In addition to two clinical meetings the Fiji Branch organized a meeting attended by local medical and dental practitioners, native medical practitioners, students of the Central Native Medical School at Suva, and the nursing staff of the College War Memorial Hospital, Suva. The occasion was the visit of Lieut.-Colonel J. Hardie Neil of Auckland, New Zealand. After his address to the Branch meeting Lieut.-Colonel Neil lectured to the native students at the Central School and on the following day he and Dr Gilmour of Auckland were entertained to luncheon by the Branch.

WEST INDIES

203 Several of the West Indian Branches have been concerned with the organization of the medical service as in British Guiana, Trinidad, Jamaica and the Windward Islands the respective Governments are evolving schemes of reorganization. The Jamaica Branch sent a deputation to the Government Committee urging that the possibilities of a scheme of National Health Insurance should be explored before any other form of reorgan-

ization was introduced. The Branch is also making an effort to expand its library, and it has encouraged interest in its proceedings by publishing its transactions for 1935-6 in pamphlet form. The British Guiana Branch has held six medico-political meetings which considered, in addition to reorganization and other matters, the question of fees under the Workmen's Compensation Act. The Grenada Branch is to be congratulated on the high average attendance it has secured at its meetings. The Southern Division of the Trinidad Branch reports a very successful year. The monthly meetings of the Division have become an essential part of professional life and the opportunities for pleasant association are much appreciated. The Northern Division has held nine clinical meetings but the Honorary Secretary expresses disappointment at the small attendances.

GIBRALTAR

204 The Gibraltar Branch has held four meetings during the year. It has continued its special work of entertaining medical officers of the Fleet stationed at Gibraltar and it in its turn was invited on board *H.M.S. Hood* by Surgeon Commander Forde, who demonstrated the methods adopted for dealing with casualties in action.

MALTA

205 In addition to its ordinary clinical meetings the Malta Branch arranged a special meeting open not only to members of the Branch but also to members of the Camera Medica and final-year students. The subject was diphtheria and the discussion was opened by Surgeon Lieut. Commander C. H. Birt.

CYPRUS

206 Since the first Annual Meeting of the Cyprus Branch in March 1936 the Branch has held five general meetings and one special meeting. For one meeting a very successful symposium on hydatid disease was arranged. The Branch hopes during the coming year to develop the social side of its activities.

EGYPT

207 The Egyptian Branch has sustained a great loss by the death of Sir Mohamed Shahin Pasha, who was an honorary member of the Association. The Branch has held five clinical meetings and one medico-political meeting during the year.

SUDAN

208 The Sudan Branch has held six clinical meetings and a medico-political meeting. It has found that its medical problems are very similar to those of the East African Branches and the representation of the Sudan Branch at the interterritorial meeting at Kampala was considered to have been of great value. It is hoped that it will be possible to arrange to hold one of these meetings at Khartoum.

EAST AFRICA

209 The interterritorial meetings hold an important place in the life of the East African Branches. In 1936 the meeting was held at Kampala, and it was attended by representatives from Uganda, Kenya, Tanganyika and the Sudan. Sir Albert Cook chose as the subject of his presidential address the medical history of Uganda. A number of papers on local diseases were read, and a resolution was passed advocating organized research by Colonial Governments into the mental and physical characteristics of East African natives.

The individual East African Branches have dealt with many medico-political problems, some of which have been referred to Headquarters.

SOUTH AFRICA

210 The Departmental Committee on National Health Insurance has recently issued its report. The subject of National Health Insurance has occupied a large share of the attention of the Federal Council and the South African Branches for some years, and the Association in South Africa is to be congratulated on the fact that the majority report is practically in agreement with all the suggestions and recommendations made by the Association. The report includes recommendations that a general practitioner service for insured persons should follow the lines of the British scheme, and that remuneration for both general practitioner and specialist services should be arranged on a capitation basis. It is considered to be unlikely that a Bill to give effect to the recommendations will be introduced into Parliament before next year.

Much heartburning has been caused amongst the profession in South Africa by the question of the payment of honorary staffs in hospitals for the treatment of the sick poor. The medical relief of the indigent is now one of the obligations of the Provincial Administrations, and the profession considers that it should not therefore be expected to give its services gratuitously as it did in the days when the sick poor were dependent upon the charity of the public. The feeling of injustice is intensified by the imposition of a professional tax, so that, as is said not only does the doctor pay his ordinary tax as a citizen but he gives his services free in the public hospitals and also pays a special tax for the privilege of doing so. After much persistent agitation by the Federal Council and the Branches the principle of payment was accepted by the Inter-Provincial Consultative Committee but the Provincial Executive of the Cape Province has offered to the profession without consulting the hospital boards an entirely inadequate figure. The offer, which was much below the minimum honorarium suggested by the Association has been rejected.

The tenth Annual Scientific Meeting is to be held in Bloemfontein in September, under the presidency of Dr S M de Kock.

The Northern Transvaal Branch reports a successful series of clinical meetings during the year, the programme covering a wide range of subjects. Two special meetings are particularly mentioned one of these being devoted to a symposium on gall bladder conditions while the second was an outstandingly successful general practitioner evening.

The Honorary Secretary of the Pretoria Division says that the Division has experienced a lively time during the year on account of its negotiations with sick benefit societies. Panel practice has now been introduced and the Division's new rules and new tariff of fees have been adopted by the two societies having a compulsory membership. The in-coming Council will have the task of dealing with the societies with voluntary membership. The Division believes that the new arrangements compare favourably with those in other areas.

The new building of the Southern Transvaal Branch has now been completed and it was formally opened by the Hon J H Hofmeyr on November 13 1936 when 300 members and their wives were present. An appeal is being made for funds for defraying the cost of the building. As a means of attracting more members to meetings the Branch proposes to introduce sectional meetings.

Reports of action taken in connexion with workmen's compensation hospital staffs and other medico-political matters and of successful clinical meetings come also from the Pietersburg and Eastern Transvaal Divisions.

ADEN

211 In the second year of its existence the Aden Branch held six ordinary meetings and one general meeting at all of which scientific matters were discussed. The Branch

has continued its policy of inviting to its meetings all registered medical practitioners who may be in Aden for the time being and a considerable number of naval surgeons belonging to ships temporarily in the neighbourhood of Aden have thus been enabled to take part in the life of the Branch. To one meeting non-medical guests were also invited.

INDIA

212 The great event for the Indian Branches during the past year was the visit of the Medical Secretary, whose notes on his tour have already been published in the *Supplement*. The United Provinces Branch reports nine meetings, to some of which final-year students and members of the staff of King George's Medical College and Hospital were invited and five meetings of the Branch Council have been held. The Bombay Branch has adopted a number of suggestions which it is hoped will improve the working of the Branch. They include the formation of Divisions within the Branch, more intensive recruitment, more frequent meetings and the appointment of a part-time clerk. The Punjab Branch has again awarded a B.M.A. Centenary Scholarship to a fifth-year student and it has spent a further sum of £87 on medical research. Fourteen lectures and demonstrations and six other clinical meetings have been arranged and the proceedings have been published for the benefit of those members who were unable to attend. The Branch has also protested to the appropriate authorities against the hardships incurred by certain medical officers employed on the North Western Railway. Reports of successful clinical meetings come from the South Indian and Madras Calcutta, Assam, Hyderabad, and Burma Branches.

CEYLON

213 The Ceylon Branch will celebrate in July the fiftieth anniversary of its formation. The celebrations will consist of scientific discussions an exhibition of medical objects of public interest a public reception and a dinner, and a special number of the *Journal* will be published. The Central Council has conveyed its cordial congratulations on the long and active existence of the Branch. The President for 1936, Dr N Attiygalle has presented to the Branch a sufficient sum to provide a President's badge. During the past year the Branch has appointed a sub-committee to formulate the views of the profession concerning the College of Indigenous Medicine and the future policy of the Branch on the general subject of Ayurvedic medicine. The quarterly publication of the *Journal* of the Branch has proved a great success.

MALAYA

214 The Malaya Branch has continued its varied activities and the list of subjects considered during the year includes fees for insurance examinations the length of service of European planters and the recruiting of non members. The Branch Council received a report from the Estates Practitioners Section and it has formed a new Dental Section.

Terms of Service of European Medical Officers in West Africa

(Continuation of para 142 of Annual Report)

215 The medical officers in West Africa have now submitted to the Secretary of State a further memorial as a rejoinder to the observations of the Colonial Office on their first memorial. The new memorial is signed not only by the medical officers in Nigeria but also by medical officers in the Gold Coast Sierra Leone, and Gambia. As Dr E C Braithwaite who is acting as secretary to the medical officers in Nigeria, will be in this

country at the end of June, it is proposed to arrange a meeting of a subcommittee to discuss the whole subject with him

Termination of Appointment of a Medical Officer in Kenya

216 The Council has received an application from the Kenya Branch for its assistance on behalf of Dr H L Gordon whose appointment as visiting physician to the Mathari Mental Hospital has been terminated by the Kenya Government for the purpose of replacing him by a full time officer. The Council considers that, in view of the special nature of Dr Gordon's work and of the research work he has performed during his tenure of office the Government should have continued his appointment as visiting physician for a short period after the introduction of the new officer and subsequently retained his services in a consultative capacity. The rearrangement of the staffing appears to have been made with undue haste and the Council proposes, therefore, to place its views before the Colonial Office

Sarawak Medical Service

217 The Council has submitted to the London office of the Sarawak Government certain representations concerning the conditions of service of Government medical officers. It is complained that although the country is prosperous, the medical staff has been reduced from seven to three members, and that it is now proposed to appoint a Director of Medical Service from outside the Service. Other causes of dissatisfaction are the withdrawal of the right to private practice the inadequate transport facilities, the deterioration of the free quarters provided and the substitution of a second class for a first-class passage for officers going home on leave. The London office of the Sarawak Government has passed the committee's letter to the Government in Sarawak.

Barbados General Hospital

218 Advertisements were received for two junior house surgeons and one senior house surgeon for the Barbados General Hospital. The salaries offered were considered to be inadequate and the general conditions of service to be poor. The advertisements submitted have therefore been refused.

SCOTLAND

Scottish Scale of Salaries for Whole-time Public Health Appointments

(Continuation of para 155 of Annual Report)

219 The whole position of the Scottish scale of salaries for whole time public health appointments is being reviewed with special reference to obtaining recognition of the scale by the local authorities

Methylated Spirits Bill (Scotland)

220 The Council has considered the provisions of the Methylated Spirits Bill (Scotland), which seeks to restrict the sale of methylated and surgical spirits. The Bill in its present form contains no provision exempting surgical or methylated spirit supplied on a prescription given by a registered medical practitioner or for the sale of such spirit by a dispensing doctor.

The Council is taking steps to ensure that, for the purposes of their profession, registered medical practitioners shall be exempted from the provisions of this Bill.

Midwives (Scotland) Act, 1915

221 Arising out of the interpretation by Glasgow Public Health Department of the scale of fees payable by

local authorities to doctors called in by midwives under Section 22 (1) of the above Act legal opinion has been obtained regarding the matter. The opinion expressed was that it was impossible for anyone to give a definite opinion on the question as to whether the fee of £1 is covered all attendance on mother and child for ten days after confinement as the wording was so indefinite and that if the matter were taken to court a judge might decide either way.

The Council is convinced of the equity of the doctor's claim, and as the Glasgow Corporation differs on the legal position the Council is exploring the question further with a view to its being referred for judicial settlement.

Report of Departmental Committee on Scottish Health Services

(Continuation of para 154 of Annual Report)

222 The findings of the subcommittees appointed to prepare a critical digest of the various sections of this report were submitted to a special Joint Committee of the parent Committee held on May 27 last and a report, incorporating these findings, is to be considered at the October meeting of the Scottish Committee.

Maternity Services (Scotland) Act

223 Reference to this Act is made in para 193 of this report.

British Medical Bureau Scottish Branch

224 A Scottish Branch of the British Medical Bureau has been established at 21 Alva Street, Edinburgh. Mr W M Scobie who has had an extensive experience of this work has been appointed Manager. He will carry out all the Agency and Accounting Business of the Bureau under the general direction of a Scottish Board. This development will afford practitioners in Scotland better facilities for taking advantage of the work carried out by the Bureau.

BUILDING

225 In accordance with the undertakings agreed upon by the Representative Body at Edinburgh, 1927 the Association is committed to begin the demolition of Block C (Nos 3-7 Upper Woburn Place) in September next and to erect thereon a building in accordance with the plans already approved by the Bedford Estate.

Proposals for dealing with this site were discussed and it was finally agreed that the Association should proceed with the proposal originally outlined at Edinburgh in 1927 and approved then by the Representative Body for the complete development of the site in pursuit of which the present gate house in Blocks A and B had been erected providing for lifts staircases corridors and land lord's services in preparation for the full development of the site.

In view of present difficulties in obtaining steel and other building materials however, the Council approached the Bedford Estate with a view to obtaining an extension of the time during which the building proposals should be executed, and the Bedford Estate has consented to a postponement of the commencement of building to a date to be agreed.

The closing of the composing department has freed the fourth floor of the North Wing B.M.A. House and plans are in preparation for the conversion of this floor into offices some of which will be available for letting.

Repairs repainting, and redecoration in accordance with the maintenance clauses in the lease are being undertaken.

E KAYE LE FLEMING

Chairman of Council

APPENDIX V

SCHEME FOR THE PROVISION OF MEDICAL ATTENDANCE AND TREATMENT FOR PERSONS OF MODERATE INCOMES ABOVE THE NATIONAL HEALTH INSURANCE LIMIT

OBJECT AND- CONSTITUTION

1 *Object*—The Service of (hereinafter called the Service) is an association of medical practitioners constituted to organize the provision of medical attendance and medicine* for persons of moderate income above the National Health Insurance limit—that is, persons whose family income is between £250 and £

2 *Area* †—The area of the Service is

3 *Members*—Any duly registered medical practitioner practising within the area may become a Member of the Service upon signing an undertaking to conform to these Rules. Members may be either Acting or Honorary. An "Acting Member" is one who undertakes medical attendance on the subscribers to the Service upon the terms laid down in these Rules. An "Honorary" Member is a member who has signed the undertaking to abide by these Rules but who does not undertake ordinary medical attendance in connexion with the Service.

4 On application for membership practitioners must furnish evidence of membership of one of the medical defence organizations and must continue effective membership of such so long as they are members of the Service.

5 *Officers and Committee*—The officers of the Service shall be a Chairman, Honorary Treasurer and an Honorary Secretary, all of whom must be Members of the Service. The Committee shall consist of the above officers together with Members of whom Members shall be elected by the local Division or Branch of the British Medical Association.

MEETINGS AND GOVERNMENT

6 *Annual General Meeting*—An ordinary General Meeting of the Members called "The Annual Meeting" shall be held before of each year. At this meeting the officers and members of the Committee shall be elected with the exception of those to be elected by the local Division or Branch of the British Medical Association and the annual report of the Committee and statement of account of the Service for the preceding year shall be presented.

7 *Special Meeting*—A Special General Meeting of the members may be convened at any time by the Committee and shall be convened by the Secretary at the earliest practicable day and in any event within twenty-one days of receiving the requisition of Members.

8 *Quorum*—At a General Meeting (ordinary or special) members shall constitute a quorum.

9 *Notice*—Subject to the provision hereinafter contained providing for fourteen days' notice in the case of a proposed alteration of Rules at least seven days' notice of every General Meeting and of the business thereof shall be given by the Secretary to all members but the accidental omission to give notice to any member shall not invalidate the proceedings of a meeting. The notice of a General Meeting (and also a members' requisition for a General Meeting) shall state the agenda thereat, and only matters arising out of the agenda shall be dealt with at that meeting.

10 *Election of Officers*—At each Annual General Meeting all the officers and members of Committee shall retire but shall be eligible for re-election.

* Where it is proposed to inaugurate a Service for the provision of medical attendance and drugs, etc., and the practitioners concerned do not desire to conduct dispensing, it is suggested that the pharmacists of the district covered by the scheme should be approached with a view to effecting an arrangement with them for the dispensing and supply of the necessary drugs and appliances.

† As far as possible the area of the Service should correspond with one or more of the areas defined under the provisions of the National Health Insurance Act. In the case of a large area such as a county subdivisions might be formed each with its own Committee, income limit, officers and officials.

11 *Powers of Committee*—The Committee may make rules for its meetings and fix a quorum. Subject to such regulations not inconsistent with these Rules as may from time to time be prescribed by the members in General Meeting the Committee shall

deal with all such matters as the appointment or dismissal of all employees or agents of the Service; make all insurance arrangements for such employees and agents as may be necessary; effect arrangements with chemists, lease premises (if any) and manage all the other affairs of the Service not required to be dealt with at a General Meeting.

12 *Members Not to Hold Contributory Contract Appointments or to Accept Lower Rates*—A member shall not conduct any private medical club nor shall he hold any contributory contract appointment whatsoever except with the consent of the Committee of the Service, such consent not to be unreasonably withheld.

13 *Canvassing and Advertising*—(1) Canvassing and/or advertising shall not be permitted by or on behalf of, any individual member of the Service, but legitimate local publicity may be given to the Service as a whole.

(2) A member shall not himself receive, or employ a collector to collect subscriptions from contributory contract patients for services or benefits rendered under the Service.

(3) No official employed in the Service is permitted in any way to influence or attempt to influence any subscriber, in favour of any particular practitioner on pain of immediate dismissal.

14 *Expulsion of Members*—Any member who shall after due inquiry by the Committee be held wilfully to have committed a breach of the conditions of these Rules or to have acted in a manner tending to increase unfairly his claim to a share in the balance of moneys available for distribution amongst the members of the Service may be expelled from membership of the Service by a vote of three-fourths of the members present and voting at a General Meeting given after hearing and considering the report of the Committee. At least seven days' notice of the meeting of the Committee at which the inquiry is to take place with particulars of the charge alleged shall be sent to the member concerned by registered post at his last known address and he shall by such notice be invited to attend the inquiry and shall be at liberty to call such evidence and to give such explanations thereat as he may desire. Production of the Post Office registration receipt shall be sufficient proof of service of the notice.

15 *Alteration of Rules*—These Rules shall not be altered except with the consent of two-thirds of the Members present and voting at a General Meeting, provided that fourteen days' notice of the terms of any proposed alteration of the Rules shall have been given in the agenda.

SUBSCRIBERS

16 *Admission*—Subject to the provisions of Rule 27 admission shall be solely through the doctor of the subscriber's choice. If the doctor considers the risk in any individual case to be too great for the ordinary premium he may arrange with the proposer for a higher premium suitable to the case and shall so inform the head office. Such arrangement may take the form of the provision of medicines by the subscriber.

17 *Eligibility*—The Service is available to persons of moderate income above the National Health Insurance limit and their dependants—that is, persons whose family income

is between £250 and £ All subscribers on admission shall make a declaration as to individual or family income as the case may be and this declaration shall be renewed annually. At the time of application also a declaration as to health must be made on the prescribed form. Should cases arise in which there may be doubt as to the eligibility of the applicants for admission they shall be referred to the Committee for its consideration and the decision of the Committee on the question of eligibility shall be final. If any subscriber shall in the opinion of the Committee cease to be eligible on economic grounds his name shall be removed from the list of subscribers.

18 *Subscriptions*—The contributions of subscribers shall be

Subscriptions shall be such as will ensure to the members of the Service a rate of remuneration commensurate with the standard of fees charged in private to those who will be eligible to participate in the Service.

19 *Arrears*—Subscribers in arrears are not eligible for benefit. After four weeks of such arrears of subscriptions their names shall be deleted from the list of subscribers and they shall not be readmitted until all arrears of subscription are paid.

20 *Choice of Medical Attendant*—(a) Except as provided in Rule 27 a subscriber shall on admission and at such other times as are provided by these Rules choose his medical attendant from the members of the Service who are willing to attend him and shall be entitled to the services of such member only.

(b) The contract of the subscriber shall be with his medical attendant only and not with the Service or the other members of the Service. In the event of a subscriber changing his address the consent of the doctor to attend at the new address must be obtained.

(c) A subscriber may change his medical attendant at any time. No subscriber in arrears shall be entitled to transfer until all arrears have been paid up.

(d) A practitioner may at any time give notice to the head office of his desire to have a subscriber's name removed from his list and unless the subscriber transfers immediately to the list of another doctor his name shall be removed from the date for renewal of subscription or at the end of three months whichever is the shorter period.

(e) A subscriber removing shall at once notify his new address to the secretary of the Service.

21 *Subscribers Cards*—Every subscriber shall on admission be supplied with a card on which shall be printed such of these Rules and such information as may be approved by the Committee including the name of the subscriber's medical attendant. Production of the card showing subscriptions paid up to date constitutes the subscriber's right to attendance.

22 *Benefits to Subscribers*—After a period of one month from the time when the first subscription has been paid and provided subscriptions are continuous, subscribers shall be entitled to the following benefits: attendance at the doctor's surgery or at home as the case may require and such medicines and dressings as are usually supplied also at the subscriber's own request an annual medical overhaul.

Subject to the consent of the medical practitioner concerned the patient may become eligible for immediate treatment under the scheme on payment of a fee of £1. This fee shall be payable direct to the doctor.

23 *Limitation of Benefits*—The Service does not include attendance at confinements, operations requiring a general anaesthetic, operative dentistry, the administration of a general anaesthetic, vaccination, special certificates and reports, appliances (such as trusses), special examinations (x-ray, bacteriological etc.) and specially expensive drugs (insulin sera etc.) and dressings not usually supplied in private practice.

FINANCE

24 *Payments*—All payments made by a subscriber shall be the exclusive property of the member who is his medical attendant at the time when such payments become due. Sub-

ject only to a rateable deduction for the expenses of the Service.

25 *Moneys Collected*—All moneys collected shall be paid into a bank to the credit of the Service.

DISTRIBUTION OF SUBSCRIPTIONS

26 All subscriptions received shall as laid down in Rule 24 be credited to the member entitled thereto. At the end of every quarter the secretary shall deduct from the amount credited to each member

(a) For general expenses of the Service (including collection) per cent

(b) For mileage per cent and shall pay the balance to the member or members entitled thereto as soon as possible after the end of the quarter.

NON CO-OPERATING PRACTITIONERS

27 The patients of non co-operating practitioners may be admitted as subscribers to the Service on application to the central office and subject to their providing satisfactory evidence of health.

Where public advertisement is contemplated for the Service one of the following provisions must be adopted.

Alternative 1

In the case of a subscriber electing to choose a practitioner who is not a member of the Service the contributions of such subscriber shall be allocated to a pool which is separate from the Members funds. There shall be deducted from the moneys paid into the pool such amount as is laid down in Rule 26 for the expenses of the Service.

Any such subscriber when submitting quarterly or yearly to the Committee or to its appointed representatives a receipted account or accounts with details as to the number of attendances and visits etc. for advice and treatment received during the previous quarter or year shall be reimbursed from the moneys in the pool in accordance with the following scale:

(Here will be inserted the Scale)

save that in the event of there not being a sufficient total sum available in the pool to meet the full charges in accordance with the above scale the Committee shall have power to make such percentage adjustments as are necessary to effect an equitable subdivision of the funds available.

The total liability of the Service towards such subscribers shall be limited to the financial dimensions of the pool.

Alternative 2

Where a subscriber elects to be treated by a practitioner who is not a member of the Service the proportion of his contributions which would normally be paid to the Member shall be credited to a fund to be known as The Non-Co-operating Practitioners Fund. Subscribers' claims relating

This will only apply in the case of a Service operating in a rural or semi-rural area when consideration might be given to the adoption of some such arrangement as follows:

Mileage—A Mileage Pool shall be formed consisting of all the sums deducted for mileage subscriptions under clause above.

There shall be set aside each year for division among members practising in areas of exceptional difficulty such a sum as the Committee shall from time to time determine and the same shall be divisible yearly or oftener as may be determined by the Committee.

The balance of the Mileage Pool shall be divisible among members in the following manner:

(a) Members practising in an urban area shall not be entitled to any share of the Mileage Pool.

(b) Members practising mainly in semi-rural areas—for example an area containing a concentrated population of 3,000 and over—shall be entitled to receive out of the Mileage Pool a sum equal to 12½ per cent. of the gross subscriptions received from their patients.

(c) Members practising mainly in rural districts—for example, an area containing a concentrated population of under 3,000—shall be entitled to receive out of the Mileage Pool a sum equal to 17½ per cent. of the gross subscriptions received from their patients.

If the Mileage Pool is not sufficient to pay in full the amounts calculated as above each payment shall be decreased in ratio to the percentages mentioned above. If there shall be any balance of the Mileage Pool after calculating the amounts due to each member under this clause such balance shall be carried to a sinking fund to be applied from time to time as the Committee may determine.

The Committee shall be entitled to pay each quarter such sum as it shall think fit on account of mileage and may retain the balance for distribution at the end of the year.

to non-co-operating practitioners services will be met out of this fund *pro rata* wholly or in part according to the amount available in the fund and to the claims against it for the period during which contributions have been paid in

TRANSFER OF PRACTICE

28 In all cases where a practice changes hands subscribers on the list of the former member shall be treated as remaining on the list of the continuing or incoming member unless the subscriber transfers to the list of another member and the amounts received from the subscriber shall be apportioned accordingly

FORMER MEMBERS

29 The subscriptions collected for any former member of the Service and not already paid to him before the date of termination of his membership shall be paid to him as soon as conveniently may be, after the deduction of his share of the common expenses and the subscribers whose medical attendant he was shall have the right to choose as medical attendant any other member who is willing to attend

30 Where a member has ceased for any reason to be connected with the Service the Committee shall have power at

such times as are deemed by it to be expedient, to bring such fact to the notice of each subscriber on the list of the member concerned

LIST OF SUBSCRIBERS

31 The Committee should supply each member of the Service with a list of subscribers contracting with him and entitled to his services and periodically thereafter with a list of additions and corrections

INTERPRETATION

32 In these Rules, where the context does not forbid words denoting the masculine gender shall include the feminine and words in the singular shall include the plural, and vice versa

APPENDIX VI

SUGGESTED INCREASE OF FEES FOR MEDICAL WITNESSES IN CRIMINAL CASES

1 The British Medical Association draws attention to the inadequacy of the fees at present payable to medical practitioners called upon to give professional evidence in Magistrates Sessions and Assize Courts, and especially in the Central Criminal Court, and urges a substantial upward revision of these fees. In this connexion the Association wishes to emphasize that the existing fees are maximum fees and are higher than those actually paid in many areas

2 The Association understands that the fees payable to medical witnesses are based upon the supposition that the practitioner gives evidence of fact only, and are intended merely to compensate him for loss of time and not to remunerate him for the skilled work and careful study involved in the carrying out of his examination, the preparation of his notes and the giving of his evidence in Court. The Association maintains that any just assessment of the fees must take into account the highly skilled and responsible nature of the duties undertaken as well as the time expended and the interference with the practitioner's ordinary work with consequent suspension or loss of professional engagements

The Nature of the Practitioner's Evidence and the Responsibilities Involved

3 It is generally recognized that the medical practitioner's evidence is frequently of considerable importance in determining the issues before the Court and that whilst he is supposed to give evidence of fact only, it is a common practice for counsel on both sides to question him upon the facts which have been submitted and to seek to obtain from him an opinion requiring professional experience and sometimes specialized knowledge

4 It is therefore incumbent on him not only to conduct with particular care the examination which will form the basis of his evidence but also to study thoroughly the pathological and other aspects of the case in order that he may be prepared to deal with searching questions, failure to answer which may reflect on his professional capacity and involve him in adverse comment in Court

5 The following are examples of the responsibilities which fall upon the medical witness

Alleged Murder or Manslaughter Suicide—A full examination of the deceased person is essential in order

to ascertain such matters as the approximate time of death, the presence or absence of external marks of violence and the significance of any wounds (whether self-inflicted and by what type of instrument produced)

An examination of the mental state of any accused person charged with murder or manslaughter is necessary, as evidence on this point may be of considerable importance

Alleged Rape—A full examination requiring special care is essential, as the evidence of the medical witness is of grave importance

Gross Indecency and Alleged Sexual Offences—The medical witness must be prepared to give evidence as to the mental standard of persons charged with these offences

Drunkenness—This class of case involves a severe test of professional skill and of the powers of observation of the medical witness

Alleged Wilful Neglect or Ill treatment of Children—The practitioner must be prepared to give evidence as to the state of nourishment of the children and as to the significance of any bruises, etc., which may have been occasioned by ill treatment

6 In short the medical witness is commonly required not only to be an accurate observer and recorder of facts but also to exercise skilled judgement in respect of matters of considerable difficulty and crucial importance. For this reason alone his present remuneration must be considered unsatisfactory

The Time Expended and the Interruption and Distraction of Professional Work

7 Before attending at Court the medical witness as has already been stated must give careful consideration to his notes and familiarize himself with all details and with the pathology of the case in order that he may be fully prepared with his evidence and be in a position to deal with points which may arise in cross-examination. Such preparation entails a considerable expenditure of time

8 The medical witness is compelled by subpoena to attend at the Magistrates Sessions or Assize Courts. In the Sessions and Assize Courts it is often impossible to give him any indication of the actual time at which he

will be required to give evidence. He has often therefore to hold himself in readiness to attend when required and it frequently happens that not until 6 p.m. in the evening is he told whether he will be required upon the next day. He must accordingly arrange his professional engagements in order that he may be free to go into Court at any moment. In general medical practice this may well give rise to serious difficulty, especially if the practitioner is single-handed (that is, has no partner or assistant). It is a common experience of members of the profession throughout the country that their attendance at Court leads to a serious interruption and disorganization of ordinary professional work.

9 The Association urges that this is a factor which must be taken into consideration and it asks that a retaining fee of one guinea should be paid for each day for which the medical witness is required by notification to hold himself in readiness to attend the Sessions or Criminal Court.

Magistrates' Courts

10 In Magistrates' Courts, where there is a closer liaison between the doctor and the other parties concerned it is frequently possible to permit the practitioner to give his evidence at a prearranged time. Moreover these Courts are usually in closer proximity to his work than are the Assize and other Criminal Courts. For these reasons the Association while insisting that the increase in the fee of the medical witness should apply to Magistrates' Courts recognizes that the fees payable in these Courts should be lower than those of the Assize and Sessions Courts.

The Special Position of London

11 The position of the police surgeon in London calls for special mention since the inadequacy of the fee is to him a particularly serious matter because of the frequency with which, in the ordinary course of his duties, he is required to appear at the Central Criminal Court and the Sessions. Moreover, owing to the volume of business dealt with at these Courts the metropolitan police surgeon has frequently to be "on call" and is often involved in heavy loss of professional emoluments as a result of uncertainty as to the time at which he will be required to appear and the consequent impossibility of conducting his practice in the manner open to other practitioners.

12 Prior to the abolition of Grand Juries it was the practice to require his attendance on the opening (Grand Jury) day and usually on one or more subsequent days. Payments were invariably calculated on a whole-day basis even when, as sometimes happened, attendance was nominal or for a short period. It was recognized that

the doctor, whether present or not was in fact retained, and that all his professional arrangements were for the time being subordinated to the requirements of the Court. With the abolition of Grand Juries this partial compensation for loss of the practitioner's time has disappeared.

Proposed New Scale of Fees

13 The Association urges that the existing scale be replaced by the following new scale:

Magistrates' Courts	£1 11s 6d for one half day's attendance
	£3 3s 0d for one whole day's attendance
Sessions or Criminal Courts	£3 3s 0d for one half day's attendance
	£5 5s 0d for one whole day's attendance

Half-Day Attendance

(a) The half-day allowance shall be paid where a witness is necessarily detained from his home or professional practice for a period of four hours or less for the purpose of giving evidence.

Whole Day Attendance

(b) The whole-day allowance shall be paid where a witness is necessarily detained from his home or professional practice for a period greater than four hours.

Retaining Fee

A witness shall be entitled to payment of a retaining fee of one guinea for each day for which he is required by notification to hold himself in readiness to attend the Sessions or Criminal Court.

Travelling Allowances

The witness shall be entitled to the following travelling allowances:

For attending a Court at a distance of over two miles:

(1) To witnesses travelling by railway or other public conveyance the fare actually paid. Railway fares except for special reasons allowed by the Court shall be 1st class, and if return tickets are available only return rates shall be allowed.

(2) Where no railway or other public conveyance is available and one or more witnesses necessarily travel by a hired vehicle the sum actually paid for the hire of such vehicle not exceeding 1s. 6d a mile each way provided that where two or more witnesses attend from the same place the total allowance shall not exceed 1s. 6d. a mile each way unless the Court is satisfied that it was reasonably necessary to hire more than one vehicle.

(3) To each witness travelling on foot or by private conveyance where no railway or other public conveyance is available, a sum not to exceed 6d a mile each way.

APPENDIX VII

MEMORANDUM UPON THE REPORT OF THE SCOTTISH DEPARTMENTAL COMMITTEE ON HEALTH SERVICES

1 While the Council has concentrated its attention on Part III of the Report dealing with Medical and Allied Services it should not be thought that it has not found other parts of the Report both informative and stimulating. Nor indeed should an absence of reference to particular recommendations be taken to imply that the Council does not find itself in agreement with them.

PART II

Heredity, Nutrition, Education, and Environment

2 Education (Chapter VIII).—The Council concurs in the suggestion contained in paragraphs 329–333 of the Education Section that the central departments for health and education should co-operate in framing a policy of

education for health. The school medical service should, in its view, provide a continuous supervision of the schools from a health point of view. It is of particular importance that health education other than that provided in schools should be a primary function of the Department of Health.

PART III

Medical and Allied Services

3 Extended General Practitioner Service (Chapters XI to XIII).—The Council is in complete agreement with the thesis that as part of a policy for the promotion of the health of the people it is necessary to secure that as far as possible all members of the community should

have available the services of a general medical practitioner."

4 With the general arguments for the extension of the existing services provided by statute, and with the proposal to secure this development by the extension of National Health Insurance to include dependants of insured persons and others in similar economic circumstances, the Council is in complete agreement. In the Association's proposals for a General Medical Service for the Nation this policy is expressed in the following terms:

Every kind of service which may be necessary for the prevention and cure of disease and for the promotion of full mental and physical efficiency should be at the disposal of every member of the community.

The medical service of the community must be based on the provision for every individual of a general practitioner or family doctor.

The medical benefits of the present National Health Insurance Acts should be extended so as to include the dependants of all persons insured thereunder and entitled to medical benefit.

5 The Association goes further than the Departmental Committee and recommends that the content of medical benefit under the National Health Insurance Acts should be widened so as to include consultant and specialist benefit.

6 With the recommendation that the basis of the employment of the general practitioner should be that obtaining in the existing National Health Insurance Scheme that is, by contract for part-time service remunerated by capitation fees and with the recommendation that the principle of free choice of doctor should be preserved the Council is in complete agreement.

7 The Association agrees wholeheartedly that the training of the general practitioner should be such as to develop the preventive outlook and has, in its Reports on Medical Education, urged the necessary modifications of the medical curriculum to secure this end. The recent recommendations of the General Medical Council if implemented by the Teaching Bodies should result in a great improvement in this direction.

8 **Maternity and Child Welfare (Chapter XIV).** *Maternity.*—With the recommendations of the Departmental Committee under this heading the Council is in general agreement. Indeed it has repeatedly urged the establishment of a comprehensive National Maternity Service based on the provision for each mother of a doctor and a midwife supplemented by consultants and institutional facilities. Continuity of medical care should as the Departmental Committee recommends be secured by the continuous medical supervision throughout every pregnancy, confinement and puerperium by a general practitioner.

9 To the Departmental Committee's proposal that the general practitioner should provide continuous ante-natal supervision and remain available for consultation at every stage of labour and the puerperium the Council would add that the general practitioner should whenever he deems it necessary attend at any stage of labour and the puerperium.

10 The Council strongly endorses the view expressed in paragraph 522 of the Report that it is taking the long view of the future of medical practice to encourage the practice of midwifery by the family doctor and to build up the maternity service on the foundation of doctor and midwife.

11 With the recommendations relating to the better practical training of doctors and midwives, the need for an adequacy of trained and properly remunerated midwives and the need for the provision of consultant obstetricians the Council is in cordial agreement. Indeed there are a number of developments for which the Association has provided as a part of a comprehensive National Maternity Service.

12 The Departmental Committee recommends that the work of the clinics should be developed in co-operation with general practitioners. It is presumed that the clinics envisaged are consultative centres to which would be referred by general practitioners those patients regarding whom they desired a consultative opinion. This in the view of the Council, is the best way of securing effective co-operation between the local authority and the general practitioner.

13 The Departmental Committee recommends an increase in hospital facilities for maternity cases, suggesting the provision of units of sufficient size to justify the employment of a resident medical officer. It is assumed that what the Departmental Committee had in mind was the increased provision of hospital beds to be available primarily for abnormal cases. So far as normal cases are concerned a method of organization based on institutionalization is unsound and unlikely to secure increased efficiency of medical service. Continuity of medical care should be maintained—throughout each pregnancy and between pregnancies—except where clinical considerations make it desirable to transfer the patient from the care of one doctor to that of another. In cases in which specialist attention is not necessary this continuous medical care should be provided by the family doctor of the patient's choice even though the patient is admitted to an institution.

14 With the recommendations relating to the giving of advice on the control of conception, with the establishment of a system of registration of stillbirths and the continuance of arrangements for investigating maternal deaths in Scotland, the Council finds itself in agreement although it suggests that the form used for the inquiries into maternal deaths should be revised after consultation with the Scottish Committee of the Association.

15 The Council agrees that the introduction of a comprehensive maternity service on the lines suggested will call for special measures and in this connexion urges an early consideration of the Association's proposals for a National Maternity Service. The special measures should secure the establishment in one stage of a maternity service of a national character administrative arrangements only being referred to local authorities.

16 **Child Welfare.**—The Council is in general agreement with the recommendations under this heading with amplifications on the lines of the Association's policy.

The infant could be taken to the doctor who had supervised the mother during her pregnancy, and perhaps attended the confinement, who is familiar with the home conditions and the family circumstances and who is at hand for emergencies at all hours of the day and night as compared with the rigidly limited time service of the infant welfare centre.

For the special purpose of instruction in mothercraft the centres are admirable and must certainly be continued. The centres should retain and even enlarge their educational and social values, but should not take on the appearance of hospitals or out-patient departments. The centres will increase in efficiency in their proper sphere when they can no longer be regarded as usurping the place of the family doctor, but are, in fact, in friendly collaboration with him.

17 On the subject of periodical medical examination by general practitioners of children under five years of age with reports to the local authorities the Council suggests that there should be a system of medical examination by the general practitioner either upon his own initiative or on reference of the child to him by the health visitor with a view to a report being made to the school authority on the health condition of the child when he enters a public elementary school. The Council is in agreement with the recommendation of the Departmental Committee that a system of medical examination by the general practitioners of children under five years of

age with reports to the local authorities should be developed

18 That there are serious gaps in organized provision for children between one and five years of age the Council agrees as it does with the suggestion that as far as possible the arrangements for children under five years of age and school children should be developed together to form one service, provided this refers to administrative arrangements only

19 School Health Service (Chapter XV)—In general the Council endorses the proposals of the Departmental Committee. The Council emphasizes that this service both in its central and local administration should be regarded as primarily a health and not an educational service

20 In order to co-ordinate the work of the general practitioner and the school health service the local authority should arrange that when the child leaves school a report is available if desired to the general practitioner on the health condition and medical history of the child as disclosed by the school medical reports. This would be of particular importance if the suggestion contained in paragraph 17 were adopted

21 The Council suggests that greater emphasis should be laid on the continuity of medical supervision and after care of children throughout school life rather than upon routine medical inspection. This should have the further advantage of bringing the general practitioner into closer relationship with the school medical service

22 Infectious Diseases (Chapter XVI)—The Council approves the recommendations under this Section desiring at the same time strongly to endorse recommendations (3) and (4) suggesting the amendment of the law so as to maintain the infectious diseases service flexible and in line with modern developments. It cannot be too strongly emphasized that there should be such a concentration in hospital units as will permit adequate facilities for accommodation and specialist treatment on modern lines. Wherever practical the infectious diseases unit should be attached to a general hospital

23 Poor Law Medical Service (Chapter XIX)—The Council concurs in the recommendations in this Section and particularly in the suggestion that the local authorities should be given by central authorities a lead in the direction of a domiciliary Poor Law medical service based on continuity of medical supervision by the family doctor of the patient's choice. This, as the Departmental Committee points out, is necessary in order that local authorities may avoid action which might cut across national policy in the development of medical services

24 National Health Insurance Medical Service (Chapter XX)—The Council welcomes the tribute paid by the Departmental Committee to the success of the National Health Insurance scheme

25 Highlands and Islands Medical Service (Chapter XXI)—In the Council's view this service would be strengthened by the introduction of a superannuation scheme for its medical officers

26 Hospital Services (Chapter XXII)—In expressing agreement with the Committee's general recommendations under this Section it is desired to draw attention to the desirability of recognizing the services of the staffs of voluntary hospitals by payment for their services. Consideration of the change in clientele and of the change in the law leads inevitably to certain conclusions. The strictly charitable basis of the voluntary hospital now exists only to the extent that the poor are still treated gratuitously, the majority of persons obtaining treatment are those who can pay and do in fact pay directly or indirectly, towards their maintenance and treatment. Although the medical profession will gladly give, as always its services gratuitously to those who cannot afford to pay for them, it is inequitable to require it to give its services without remuneration to voluntary

hospitals which treat persons able to pay and which in practice collect payments from a large number of their patients. The field of private practice has inevitably contracted with the result that consultants and in particular the younger consultants are finding it increasingly difficult to secure and maintain a standard of living which represents a reasonable reward for their services and which enables them to maintain the highest possible standard of professional efficiency. There should be remuneration of the hospital staff in respect of all medical services in hospital for which payment is made, directly or indirectly—by contributory scheme, local authority, employer or patient. The voluntary hospital and the county or county borough authority, in the area where the powers conferred under the Local Government Act are being properly utilized are serving the same section of the community and the principle of remuneration for services rendered should be adopted in both kinds of hospital

27 The Council notes with interest the proposals contained in recommendation (8) in regard to a method of supervision and guidance of voluntary hospitals by the Department of Health in Scotland and wishes to make it clear that it does not necessarily follow that this method could be applied with success to England and Wales

28 Mental Health Service (Chapter XXIII)—The Council concurs in these recommendations suggesting at the same time that accommodation should be provided in general hospitals for observation beds and beds for early and minor cases of mental disorder and subject to the important proviso that Recommendation 7 should apply to all children, and not only to those under 5

29 Industrial Health Services (Chapter XXIV)—The Council is not satisfied that a case has been made out for the separation of occupational from other diseases for the purposes of clinical observation

30 Dentistry (Chapter XXV)—The Council desires to emphasize the importance from a medical point of view of an efficient dental service. Insufficient use is being made by parents of facilities provided by the school dental service even in those cases where dental treatment is provided

31 Other Services (Chapter XXVII)—The Council agrees that there should be available special diagnostic and treatment facilities, utilizing so far as possible voluntary agencies, supplementing them where necessary

32 With regard to the provision of a consultant and specialist service the present policy of the Association is that a consultant service and all necessary specialist and auxiliary forms of diagnosis and treatment should be available for the individual patient, normally through the agency of the family doctor. The method by which these services should be provided, however, is not laid down in the policy of the Association, and the Council will report further upon this matter

PART IV

Finance and Administration

33 Finance (Chapter XXVIII)—The Council strongly supports the observation of the Departmental Committee that true economy is to be found by reducing the burden of ill health by the adoption of a co-ordinated national health policy. In relation however, to the financial proposal that a capitation fee of 6s per annum should be payable for medical attendance on the dependants of insured persons the Council regards the amount suggested as grossly inadequate

34 Administration (Chapter XXIX)—In the Council's view units of local administration should be of a size and nature and enjoy a rateable value such as would permit the organization of a comprehensive and efficient health service

35 On theoretical grounds the proposal to create for the purposes of health administration, regional areas related

to natural hospital areas rather than local government boundaries is one which has much to commend it. Practical considerations, however, lead to the conclusion at the present juncture that the more expedient method of establishing units of efficient proportions would be by the transfer of the health functions of the smaller authorities to those larger authorities which are of sufficient size and rateable value. An essential administrative safeguard would be the establishment by the local authorities to which health functions are assigned of a statutory committee to which would stand referred all questions relating to the medical and allied services.

36 Certain services however, and particularly those of an institutional character cannot be efficiently and economically managed by many even of the larger existing authorities. The Council welcomes therefore the Departmental Committee's recommendation that the powers of the central department for initiating and securing schemes of co-operation among local authorities should be strengthened.

37 The National Health Insurance service would require special treatment. It should remain under central management, the local administration should provide for adequate representation on the appropriate committee and sub-committee of the bodies now represented on insurance committees and the establishment of a professional committee comparable to the panel committee with similar duties and functions.

THE ASSOCIATION OVER-SEAS

The meeting of the Dominions Committee on May 24 over which Dr William Paterson presided was occupied to an unusual extent with what may be called personal questions—that is to say questions relating to pay, promotion status, or privileges of individual medical officers or small groups in the Colonial Medical Service. It is inevitable that in such a service, with its members isolated and subject to varying administrations in all parts of the world such questions should arise more frequently than in the public health service at home and when the matter is beyond adjustment by the local Branch recourse is naturally made to headquarters of the Association as represented in this instance by the Dominions Committee. The Committee has some very delicate work to do much of it of a kind which cannot usefully be published.

On this occasion the cases which came before the Committee related to places as far away as British Honduras, Barbados, Kenya, West Africa and Egypt. One complaint from a medical officer attached to a Government service for example was that for the third time seniority had been set aside: he had been passed over for an expected appointment and the Government had appointed a young man believed to be under 30. This complaint is not infrequent in the Colonial Medical Service but in this instance there was an added touch. The officer making the complaint stated that he had learned from a member of the Legislative Council who had been to see the Governor on the subject that the Governor had wired to the Colonial Office that he wanted an Englishman. The officer in question happened to have been born in Bombay and several of his colleagues had been born in distant parts of the Empire. If the condition of actual birth in the home country is insisted on it will on the basis of past experience rob the service of a good deal of distinction. Not a few men in the Colonial or the Indian Service were born into it and are none the less of British birth and tradition because their fathers were serving at the time it came over to them.

The treatment accorded to one member in an African colony was the subject of a long memorandum placed before the Committee. This member had been dismissed from his post as a medical officer attached to a Government hospital for the reason given being that a younger and more active man and a whole-time officer was required. It was pointed out that the member in question was a doctor of medicine and was in full health and vigour

and no suggestion has been made that he is unequal to his work. The point is, however, that the effect of the decision is to bring to an end a first-class piece of research work involving a psychological and physical study of the African native, a work which has aroused widespread interest in this country. The Dominions Committee decided to communicate with the Colonial Office on the subject.

The question of the Sarawak Medical Service (which is not a part of the Colonial Medical Service) was again before the Committee. It is stated that it is now proposed to second medical officers from Malaya to the medical service in Sarawak. One of the main points for which the Sarawak medical officers have pressed is that they should be treated similarly to the medical officers in Malaya. If the conditions of service in Sarawak are to be improved it seems only equitable that before there is any such seconding of officers who had resigned because their representations hitherto had failed should be given an opportunity of returning to the service.

European Medical Officers in West Africa

The position of European medical officers in West Africa engaged the close attention of the Committee, which appointed a sub-committee to explore the possibilities of the most useful action. A memorandum from Nigeria stated that according to the revised scale for 1935 there has been an actual reduction in the emoluments of certain officers although during recent years their work and responsibilities have greatly increased. In proof of the latter point some remarks are quoted from Sir Walter Johnson who was from 1929 until recently director of medical and sanitary services in Nigeria. He stated that in the old days the Government doctor was the cantonment doctor, whose work consisted of looking after the medical needs of a few European officers, African troops and a prison. Usually his work was finished in less than half a day. Now quite 90 per cent of the Government medical officer's time is spent upon medical work for the general African population and the day is all too short for the huge volume of work he gets through.

It was also stated that the European official population has been considerably increased largely owing to the action of the Governments of West African colonies in offering every inducement to wives of Government officials to go out for at least a part of their husbands' tour, resulting in more work for the men engaged on the clinical side. It was claimed that there had been discrimination between the administrative and the medical departments, the pay and the prestige of the former being raised and that of the latter being lowered although since the salary rates were fixed seventeen years ago there had been such a vast increase in the work and responsibilities of medical men. A memorial on the subject has been addressed to the Secretary of State signed by 104 medical officers from Nigeria, thirty from the Gold Coast, nine from Sierra Leone and five from Gambia. He is asked to appoint an impartial committee to go into these matters.

The Committee considered the arrangements for the Overseas Conference to be held during the Annual Meeting at Belfast and some general conversation took place on the desirability of sending a member of the Medical Secretariat on a colonial tour in order to establish contacts, investigate difficulties on the spot, and increase the likely effectiveness of action by the Association.

A memorandum has been sent to all county, county borough and metropolitan and municipal borough councils by the Air Raid Precautions Department of the Home Office drawing attention to the necessity in matters of air raid precautions of the closest co-operation between the local authority and the occupiers of industrial or business premises in its area. The memorandum points out that even the largest establishments in which an air raid precaution scheme may have been prepared will look to the local authority for various services which are beyond their resources to provide.

TESTIMONIAL TO DR GUY DAIN

The objects of the Fund are to honour Dr Dain for his valuable services to the medical profession during the past twenty years and to give effect to Dr Dain's wish that the amount subscribed shall be utilized for the purpose of assisting the education of sons and daughters of medical practitioners who are in need of such help.

GENERAL MEDICAL COUNCIL

DISCIPLINARY CASES

Adultery and Professional Relationship

The Council on May 28 and 29 considered the case of DOUGLAS CHEETHAM PIM DSO MD 1920 U Dubl registered as of Brecon Road, Abergavenny who was summoned on the charge of having committed adultery with Mrs Anne Alma Ferguson on various dates during 1935 and that in August, 1933 the said Mrs Ferguson had consulted him about the health of her son and during the years 1934-6 he had also stood in professional relationship with Mrs Ferguson and her son and maid-servant. The complainant was Mrs Ferguson who was represented by Mr J P Valetta counsel. Dr Pim was defended by Mr W A Macfarlane counsel instructed by Messrs Le Brasseur and Oakley on behalf of the London and Counties Medical Protection Society.

Mr Valetta in opening the case said that it was one in which dates were very material. The defence was that Dr Pim knew Mrs Ferguson as a child and met her again in July 1933 on holiday in Ireland when old acquaintance was renewed and shortly afterwards intimacy occurred. This adultery in 1933 was not the consequence of any professional relationship. Mrs Ferguson, on the contrary stated that adultery took place for the first time in January 1935 when she and Dr Pim went together for a week to Torquay. She denied that he knew her as a child. After she had met him socially in Ireland in 1933 she consulted him about the health of her son. A specialist had diagnosed tuberculosis, but Dr Pim, after examining the boy contradicted that view and his opinion was confirmed by another specialist. Dr Pim had earned her gratitude by this and other services on behalf of her son. He afterwards told her of his domestic unhappiness, and before January 1935 she was told that he and his wife had parted. In March of that year to her surprise she was served with divorce papers naming her as intervener but the petition was withdrawn within a few days and Mrs Ferguson discovered that Dr and Mrs Pim were again living together. This inquiry had been forced upon Mrs Ferguson by reason of scurrilous statements circulated in the town—Cheltenham—in

or in the locality of which the parties had resided. It was said that she had broken up the Pim ménage and taken the man away from his wife which was entirely contrary to the facts.

Mrs Ferguson in evidence said that her marriage with an Australian had been dissolved owing to desertion there was no question of misconduct. She first met Dr Pim in Ireland in 1933 but no misconduct took place nor was it ever suggested. She spoke to the subsequent medical examination of her son by Dr Pim certain small attendances upon herself including an anaesthetic for a dental operation and attendance on her maid-servant who was Dr Pim's insurance patient. She denied in cross-examination that she had told certain persons in Cheltenham that she was taking these proceedings to get revenge on Dr Pim.

Dr Pim in evidence reaffirmed his declaration that he had known Mrs Ferguson as a child that he had met her in Ireland in 1933 when acquaintance was renewed and shortly afterwards after they had been to a dance together misconduct took place. Later he had written to her that as he was married the association had better cease but she threatened to commit suicide and begged him to renew their friendship. He denied that he had examined her son or was associated with the decision to seek a specialist. Mrs Pim gave evidence confirming that of her husband and said that it was in November 1934 he admitted to her that he had committed adultery with Mrs Ferguson.

After the case had been considered *in camera* the Council found the facts alleged against Dr Pim proved to its satisfaction and directed the registrar to erase his name.

Canvassing

The Council considered the case of BAKHTAVAR SINGH JAIN registered as of Wocley Castle Road Selly Oak Birmingham who appeared on the charge that he had canvassed patients of other practitioners in particular, in October 1936 one Alfred Bird whose transfer to his insurance list he procured and one Arthur Eccleston and his wife whom he endeavoured to obtain with their child as his patients. Similar allegations were made with regard to two other patients.

The complainant was Dr Francis R Gedye who was represented by Mr Macfarlane counsel instructed by Messrs Le Brasseur and Oakley, solicitors, and Dr Jain was defended by Mr A Davies counsel, instructed by Messrs Cole and Matthews. An application had been made earlier during the Council proceedings on behalf of Dr Jain that the case might be postponed in view of the fact that writs for slander had been issued by him against a certain person or persons, and the case might be expected to be heard shortly at Birmingham assizes. The application was refused. Mr Macfarlane called no evidence to support the charge of canvassing. Albert Bird. He called Mrs Eccleston whose doctor had been Dr Gedye who stated that Dr Jain called on her and gave her a professional visiting card. Mr Arthur Eccleston, her husband also gave evidence that he had overheard Dr Jain ask his wife if she and her husband would go on his panel. A document was put to this witness which he admitted writing and signing at a later date. In this he declared that the doctor had not asked him and his wife to come on to his panel and that the allegations of canvassing had been put into his mouth by a solicitor's clerk. He now said that he had written this contradictory statement at the respondent's dictation. He was told by Dr Jain that he was taking proceedings for slander against another doctor and that if he (Dr Jain) did not win his case before the GMC the witness would be brought into the slander action and get into serious trouble. He therefore considered the best thing to do was to wash his hands of the case.

Mr W H Evans, who was on the list of Dr Thomas said that Dr Jain had asked him on whose list he was, and whether he would like to change over to his. In cross-examination he said that after he had made a statutory declaration a gentleman whom he did not know had induced him to sign a contradictory statement of which part was true and part was not, as he had got timid.

Mrs Florence Jones gave evidence as to a doorstep conversation with Dr Jain who had asked her as an insured person whether she would like to sign on to his list. He gave her a card which she had burnt. Mrs Ellen Atterbury also gave evidence that Dr Jain had called and left his card.

Dr Jain, in evidence said that he had once nearly a year ago treated Mrs Eccleston's child and the visit was entered in his day book which he produced. He merely saw Mrs Eccleston standing at her door and asked after the child he had treated. He had not seen her husband nor given a card nor indicated that he wanted to attend. Later Mr Eccleston told him that he had been pestered by solicitors and their clerks to go up to London over the case and wished to wash his hands of the affair because he had made a statement which was not correct and had simply been prepared for him to sign. Eccleston thereupon wrote another statement in his own words, no part of it being dictated to him. His conversation with Mr Evans was due to the fact that he thought he was another Evans a brother who had been his patient, and whose record card he had been asked by the insurance committee to return. His conversation with Mrs Jones was a chance one begun by her with the remark that she had a cold and was coming to see him; he did not ask her to sign on as his patient. His visit to the Atterburys was merely to ask the man to attend to the garden of his surgery. He had never invited any of the witnesses to come on to his list.

The witness was closely cross-examined as to the entries in his day book relating to his attendance on the Eccleston child and it was suggested by the Legal Assessor that 1937 had been altered to 1936. The witness replied that the material must have been copied from another book and by a slip of the pen the entries had got out of chronological order.

The Council found that three of the charges had been proved to its satisfaction and instructed the registrar to erase the name of Bakhtawar Singh Jain from the *Medical Register*.

Charges of Canvassing Dismissed

The Council dismissed the charges relating to canvassing brought against HUGH McNICHOLL, registered as of London Road, King's Lynn. It was alleged that in 1936 or 1937 or both years he had canvassed the patients of Dr Guy Kinnear by furnishing or causing to be furnished to them his professional cards. Ten charges in all were set out, some relating to the canvassing of named persons and others to the employment of two persons as agents. The complainants were the London and Counties Medical Protection Society represented by Mr Macfarlane, counsel, instructed by Messrs Le Brasseur and Oakley, and Dr McNicholl was represented by Mr Charles Davis, solicitor of Messrs Bulmer and Davis. Dr Guy Kinnear, a practitioner of Nottingham, London, S.E., gave evidence that he started practice in that neighbourhood in 1935 and the respondent came afterwards, living about a mile away. A man who with his wife and daughter had been attended by Dr Kinnear for some time had brought witness a professional card of the respondent, which was put in evidence. A woman witness gave evidence as to calls made upon her by the respondent and was cross-examined. Dr Charles Wortham Brook, another practitioner of Nottingham, also testified as to having received respondent's cards from a number of his patients. He denied that he was co-operating with other practitioners to get the respondent out of the neighbourhood, but respondent was putting them in a difficult

had taken some cards without his knowledge and distributed them. Evidence on behalf of the respondent was given by four other witnesses.

After deliberation by the Council in camera the President announced that the charges had not been found proved.

The last case was that of ALBERT RUDOLF RELLUM, registered as of Dockhead, Bermondsey, who was charged with having canvassed certain patients of Dr Joseph Frelich who brought the complaint. Dr Rellum was accompanied by Mr John Ritchie, counsel.

Dr Frelich stated that Dr Rellum had formerly been his assistant. After he had left his service a patient Mrs Selley called at his surgery and told him that the respondent had been canvassing members of her family who were patients of his. Mr and Mrs Selley and two sons gave evidence, but at the conclusion of the complainant's case without calling upon the respondent the Council decided that the charges had not been supported to its satisfaction.

The final act of the Council at the end of its five day session was to re-elect Mr Michael Heseltine as Registrar. Sir Robert Bolam, in making the proposition, complimented Mr Heseltine on the excellent services he had rendered during his four years of office.

Correspondence

CHIROPODISTS AND OPTICIANS

SIR.—It is announced apparently with authority that the Board of Registration of Medical Auxiliaries has decided to include in its register chiropodists who pledge themselves to confine their activities to the treatment of abnormal nails and all superficial excrescences occurring on the feet such as corns, warts, callosities, bunions, etc. As this formula was refused "recognition" by the Annual Representative Meeting in 1934 it must be presumed that the representatives of the British Medical Association on the Registration Board have been outvoted by their colleagues and that they are now anxiously considering their position. The bond it appears is not all on one side. Whether chiropodists consent or do not consent to the prescribed limitation of their activities is their own affair, but medical practitioners will read with surprise as part of the bargain that doctors will in future be required to send their patients to a registered chiropodist only. Thus the Board undertakes whether with or without authority to give pledges as well as to accept them, though it is difficult to believe that the representatives of the B.M.A. on the Board are consenting parties to these arrangements.

The position is rendered the more acute by the parallel proposal of the Minister of Health to establish a register of opticians who are to receive official recognition as competent to treat errors of refraction, to detect the presence of disease and not less important and not less difficult to certify the absence of disease.

The candidates in each of the two groups urge one and the same plea—namely, practical training in the recognition and treatment of abnormal conditions occurring in a particular and limited part of the body, the foot in the one case, the eye in the other, the acquisition of skilled craftmanship in dealing with these conditions, and again the ability in the one concerned to recognize in spite of the lack of medical training the presence or absence of any pathological condition that would call for the care of a medical practitioner.

The answer to these claims need not be stated in detail. It includes a recognition of the right of the individual citizen to choose for his medical advice whom he will, an inability on the part of the medical profession to accept responsibility for any treatment based on the opinion or diagnosis of any person who has not as a minimum been trained and examined in the terms of the medical curriculum, and an affirmation of the need in the public interest of maintaining a ready recognition of the distinction between practitioners who have been recognized as qualified medical practitioners and those who have not been so recognized. The immediate point is that the latter are not

applicable equally to the two groups here concerned and that the setting up of a 'register' in the one case as in the other tends to blur in the public mind the distinction between fully qualified medical practitioners and other persons who what ever their merits are not fully qualified medical practitioners. If the Registration Board is to be allowed with professional approval to set up a Register of Chiropodists with what countenance can the profession oppose the Register of Opticians favoured by the Ministry of Health?—I am etc

London W1 June 12

C O HAWTHORNE.

SIGHT TESTING OPTICIANS AND OPHTHALMIC BENEFIT

SIR—Through the kind offices of the Member for my constituency I was able to listen to the debate on the Ministry of Health Estimates in the House of Commons on June 8. The Minister in a laudable speech embracing his many excellent wares and services did not refer to his proposal to permit immediately the setting up of a register of sight testing opticians.

Sir F Fremantle (St Albans) flourishing a batch of telegrams of objection to such regulations in a depleted House of at most thirty Members dealt with the matter concisely but comprehensively and with appropriate emphasis in the discussion which followed. He reminded the House of the findings of two relevant departmental committees declaring against such ultimate responsibility of diagnosis being placed in the hands of opticians; he also pointed out the adequacy of existing arrangements set up in the form of the National Eye Service expressly to meet the demand in question—that of the insured population. He might well have reminded the Minister of his own agreement with the view of the profession opposed to such recognition as expressed by an influential medical deputation.

I was unable to remain to hear the Parliamentary Secretary reply to the debate; he was reported to have mentioned the matter stating practical difficulties of universal application of the benefit and insufficient education of the public in the use of the present facilities. If this were true could not the Minister include consideration of this matter in his intended

Use Your Health Services drive next autumn? He surely would not remedy the existing alleged failure to use the ante-natal services (for so he complains) by vesting diagnostic responsibility in midwives!

Even if it could be admitted that practical difficulties in meeting the demand exist it would I submit, be the duty of the profession strenuously and unequivocally to express its opposition to the 'recognition' of a register granting such powers whether directly or inferentially to a group of opticians so long at any rate as they have not the means to an essential knowledge of clinical pathology.

In my view the ability fully to appreciate the eye not merely as an optical apparatus, however wonderful but as a living neurovascular organ lies at the root of the matter, and may account for the apparent apathy of the influential lay public to the fundamental issue involved.

I suggest that an invitation to Members of Parliament to consider the danger and to make individual representations to the Ministry would be treated sympathetically and would meet with the desired effect—I am etc

Barnes SW June 9

INSURANCE CAPITATION FEE

SIR—In the Memorandum of the Minister of Health published in the *Supplement* of May 29 (p. 317) it is stated that the hospitals have relieved the general practitioner of many of his more onerous responsibilities (paragraph 28) and this is used as an argument for the reduction of the capitation fee. Whatever the case in large towns the facts are very different in the smaller ones where the hospital staff consists entirely of the general practitioners of the district and the conditions in Melton Mowbray must be similar to those in many other places of the same size.

In paragraph 26 it is stated that cases of incapacity in hospital have increased by 12 per cent in two years and this is in keeping with our impressions. Here we have a hospital consisting partly of private but mainly of free beds. It started in 1920 as a cottage hospital containing six beds, now there are thirty six beds and an extension that will give us over fifty beds is nearly complete. The annual maintenance is covered by voluntary subscriptions derived for the greater part from small payments from the insured class—a fact that shows that the services provided give satisfaction.

Except for unusual major operations and a few special orthopaedic ones which are performed here by visiting consultants and the specialties (for example radium applications ear and eye cases) which are sent elsewhere all the common medical and surgical ailments are dealt with entirely by the local staff each member of which is on the panel. For instance one doctor has made himself competent in x-ray and plaster work another has interested himself especially in medicine and takes charge of the difficult diabetics does blood counts etc two others divide the surgery and so on. As there is no house surgeon the after-care of operation cases devolves also on the staff and may entail many extra day and night visits.

The point I wish to make is this that whereas in the big towns a panel doctor may send his difficult case to hospital and be relieved of the treatment here we send the patient to hospital also but have to follow him there and administer the treatment ourselves. The difference in the amount of time and responsibility entailed is enormous. Last year in the free wards there were 443 admissions and 297 operations—all of these were from the insured class and the majority were actually insured persons. Fractures treated mostly without admission numbered 101 with 170 applications of plaster. These figures take no account of cases treated but not admitted to beds such as those of abscesses of all kinds, extensive cuts foreign bodies in the hand and many other troublesome conditions which the practitioner in the large town would automatically send to hospital.

What would be considered the adequate fee if these services had to be given by individual panel doctors throughout the country? Or what would a London panel doctor think if when called in the middle of the night to a case of intestinal obstruction he then had to wake one colleague to give the anaesthetic and another to assist while he did the operation? Of course so far as we are concerned the present fee is ridiculously inadequate and we could not exist to give the services we do but for the income derived from private practice. Our consolation is the added interest we have in our work but when I read the account of the specious case that is being made to reduce the capitation fee I feel that doctors placed as we are here can at any rate answer very completely the charge that hospitals are doing our work. We have every reason to demand some encouragement for what we do by a very considerable advance in the present rate of payment—I am etc

Melton Mowbray, June 6

H S FURNESS

SIR—As one of those who have started insurance practice since that fateful year 1924 I would in all humility draw your attention to a few aspects of the question of the capitation rate which have not received a proper airing during the Court of Inquiry.

In the first place I think that I am expressing the thoughts of a number of my colleagues when I say that the findings of the 1924 inquiry have no meaning for me. They were arrived at before I even started medicine and seem irrelevant. I would estimate that half the insurance doctors have changed since that date. No keen young practitioner can feel that he is being adequately remunerated for his work on the present scale of 1s 6d a service but unfortunately it is the only way of starting a practice. The security of a panel is the only one accepted by those agents who lend money to the impecunious young doctor. Again the introduction it affords to the private side of practice is not to be ignored. It is, however, begging the question to give these as reasons for keeping the capitation fee at the insignificant figure at which it now stands.

Notice of Extraordinary General Meeting

Notice is hereby given that an Extraordinary General Meeting of the British Medical Association will be held at the Assembly Hall, Belfast, on Tuesday, the 20th day of July, 1937, at 12.30 o'clock in the afternoon or as soon thereafter as the Annual General Meeting of the Association shall be terminated, when the following resolution, with or without amendment, will be proposed as a Special Resolution

RESOLUTION

THAT the Articles of Association of the British Medical Association be altered in manner following

(i) By inserting in line 1 of Article 5 before "By laws" the words "Regulations or" and by inserting at the end of the same article the following additional paragraph

Provided always that in the case of any person who shall have been a Member of the Association for a period of 50 years no further annual subscription shall be payable as from the 1st of January next succeeding the expiration of such period or in the case of existing Members who have been Members for more than 50 years then as from the 1st of January 1938 but so that this proviso shall be without prejudice in the case of a Member who is a Member of a Corporate Branch or of a Corporate Group to his obligations as such Member of the Corporate Branch or of the Corporate Group

(u) By adding to Article 6 the following additional paragraph

Provided further that in the case of any person who shall have been a Member of the Association for a period of 50 years such person shall without payment of any annual subscription as from the 1st January next succeeding the expiration of such period or in the case of existing

Members who have been Members for more than 50 years then as from the 1st January, 1938 and during the continuance of his Membership be entitled to all the privileges aforesaid but so that this proviso shall be without prejudice in the case of a Member who is a Member of a Corporate Branch or Corporate Group to his obligations as such Member of the Corporate Branch or of the Corporate Group

(iii) By substituting in Article 7 lines 6-8 the words "Under Article 9 (c) or (d) for the words by reason of his conviction or expulsion as hereinafter provided

In relation to "Associates" and "Associateships"

(iv) By amending the headings to Article 3 to read as follows

II—MEMBERSHIP AND ASSOCIATESHIP

ELIGIBILITY FOR MEMBERSHIP

(v) By inserting after Article 4 the following new Article

Each Branch shall have power to elect as Associates such persons and in such manner as the By-laws may provide and to admit Associates so elected to such privileges (not being inconsistent with the provisions of the Regulations and of the By-laws) as may from time to time be conferred on them by or under the By-laws

An Associate shall not be a Member of the Association or of any Division or Branch thereof for any purpose and no Associate shall act as a Member of the Council representative or officer of the Association or of any Branch or Division or be entitled to receive notice of or to be present or to vote at any General Meeting of the Association

(vi) By inserting in line 2 of Article 5 after "Member" the words and Associate and in line 6 of the same Article after Member the words "or Associates."

(vii) By inserting after Article 6 the following new paragraph

Each year's subscription shall entitle the Associate to the privileges (not being inconsistent with the provisions of the Regulations and of the By-laws) which may for the time being be conferred by or under the By-laws on Associates of that Division and of that Branch of which he is an Associate

(viii) By inserting in line 1 of Article 7 after Member" the words or Associate, in line 5 of the same Article after membership" the words or his former associateship (as the case may be) and in line 6 of the same Article after membership" the words or associateship"

(ix) By amending the heading to Article 8 to read as follows

Duration of Membership and Associateship

(x) By amending line 1 of Article 8 to read as follows

Every Member and Associate shall remain a Member or Associate (as the case may be) until his

By inserting in line 2 of the same Article after "membership" the words or associateship (as the case may be)"

(xi) By amending the heading to Article 9 to read as follows

Termination of Membership and Associateship

and by inserting in the same article the following words

In line 1 after membership the words or associateship"

In line 1 of (a) after "who is a Member the words or Associate"

In line 13 of (c) after (iv) the words "in the case of a Member

At the end of (c) the following words

or (v) in the case of an Associate if he ceases to be entitled to legal recognition as a member of the medical profession in the country in which he is permanently resident.

struction in air raid precautions would begin in a few weeks time

Dr A V NEALE (Birmingham) demonstrated the following interesting cases: streptococcal empyema in a child; polio myelitis; spinal tumour with paraplegia; diabetes treated with protamine insulin; pernicious anaemia after pregnancy; diverticulitis and carcinoma of the colon; Simmonds' disease.

CAMBRIDGE AND HUNTINGDON BRANCH ISLE OF ELY DIVISION

At a meeting of the Isle of Ely Division held at March on May 18 Dr J W BONE (Luton) gave an interesting lecture on the British Medical Association World Tour. Dr Bone illustrated his remarks with a film of the tour and both his address and the film were greatly appreciated.

CEYLON BRANCH

A special general meeting of the Ceylon Branch was held at the Colonial Medical Library, Colombo on January 11 with Dr N ATTYGALLE in the chair. The meeting had been convened in order to give members an opportunity to meet Sir RICHARD NEEDHAM who gave an address on 'Medical Education in the East'. On the motion of Dr J R BLAZE, seconded by Dr H O GUNewardene, a vote of thanks was accorded Sir Richard Needham for his address.

At a meeting of the Branch held at the Colonial Medical Library, Colombo on January 27 with Dr BLAZE in the chair, Dr Frank Gunasekera was elected representative in the Representative Body and Dr H C P Gunewardene a delegate to the Annual Meeting of the British Medical Association at Belfast. On the motion of Dr V GABRIEL, seconded by Dr H M PERIS, the Branch Council was elected with power to co-opt other members when necessary, as the committee to work in connexion with the celebrations of the fiftieth anniversary.

The new president Dr ATTYGALLE delivered his inaugural address on 'The Problem of Carcinoma of the Uterus in Ceylon'. On the motion of Dr S T GUNASEKARA, seconded by Dr LUCIAN DE SILVA, a vote of thanks was accorded Dr Attygalle for his address.

A special general meeting of the Branch was held at the Colonial Medical Library on February 2 with Dr ATTYGALLE in the chair. The president introduced Dr M J STEWART, professor of pathology in the University of Leeds who gave an interesting address on 'Medical Research' for which he was heartily thanked.

At a meeting of the Branch held at the Colonial Medical Library on February 17 with Dr ATTYGALLE in the chair, a communication from the Minister for Health regarding medical certificates for Government employees was considered. After a lengthy discussion a motion by Professor P B Fernando, seconded by Dr S R GUNewardene, was carried by eleven votes to three as follows: 'That subject to the rights of employers to employ their own medical examiners the Ceylon Branch recognizes the principle that every registered medical practitioner has a right to issue medical certificates.'

Dr C C de SILVA showed a case of hereditary ectodermal dysplasia and reported on three other similar cases.

At a meeting of the Branch held at the Colonial Medical Library on March 17 with Dr ATTYGALLE in the chair, Dr de SILVA read a paper on 'Hereditary Ectodermal Dysplasia' and Dr J H F JAYASURIYA read notes and demonstrated a case operated on for spinal cord tumour, a case of old standing chronic empyema treated by phrenic evulsion and major thoracoplasty and a case of cerebral tumour operated on a year previously. The two speakers were thanked by the meeting for their addresses.

DORSET AND WEST HANTS BRANCH BOURNEMOUTH DIVISION

At the annual meeting of the Bournemouth Division held at Boscombe Hospital on April 28 with Dr J C A NORMAN in the chair, the annual report and financial statement of the Division were unanimously adopted.

The following officers were elected for 1937

President: Dr J DIXON Green; Vice-Chairman: Dr R J MAULROY; Treasurer: Dr O C CARTER; Dr E Douglas Granger, Representative Body; Drs Walter Asten and Carter.

Deputy Representatives in Representative Body: Drs Norman and C E Gautier-Smith.

Auto serum Treatment in Drug Addiction

Dr MARGARET VIVIAN read a paper on 'Auto-serum Treatment in Drug Addiction'. Dr Vivian said that this treatment was discovered accidentally by a Dr Modinos in Egypt when he was treating a patient by these means for arthritis,

and he had published a paper which had fascinated Dr Vivian and she had decided to try the treatment herself. She had treated nine patients and although she did not claim that they were free from the liability of relapse she could claim that in a short time and in a very pleasant way they could be entirely taken off the drug to which they were addicted. The technique was to raise a blister and withdraw the fluid up to 9 ccm in quantity and inject it into the patient. This was repeated again after three days and in some cases a third injection was given on the seventh day. Dr Vivian then gave details of two cases in the first of which she had great trouble in raising a blister at all but eventually succeeded in getting a canthos plaster that raised a good sized blister on the patient's abdomen. Ten ccm of fluid was then injected and the patient's daily dose of morphine which had been 3 grains was at once cut down to a grain and a half. To Dr Vivian's surprise she began to sleep and eat well and showed no signs of distress. Three days later another blister was raised and 7 ccm of fluid was injected. After this no morphine at all was given but a small dose of dionin was substituted. The patient continued to sleep and eat was quite oblivious of the fact she was not having her usual dose of morphine and felt very well. Three days later there was a third injection and the patient felt wretchedly ill and vomited for several days. However the patient who was a medical woman felt she could stay in the home no longer and returned to Scotland to her practice. She arrived home worn out and with a bad headache but had kept well ever since.

In the second case a doctor had been taking thirty grains of morphine, ten grains of cocaine and a bottle and a half of whisky a day. The first day the patient was admitted blisters were raised the fluid injected and the patient given a relatively small amount of morphine. He slept and ate well and made no complaints at a daily dose of two grains of morphine for the first three days. No whisky was given or cocaine at any time. Three days later 10 ccm of fluid was injected and a quarter of a grain of dionin was substituted for the morphine the patient making no complaint of needing morphine. The following night he seemed excited and unlikely to sleep and Dr Vivian asked Dr H J A. Simmons to give him some sodium cyanide in order to ensure a good night's sleep. This was administered on three consecutive nights and the patient slept from six to eight hours on each occasion. A third blister fluid injection was given three days later since when the patient has had no further need or desire for drugs or alcohol. Dr Vivian closed by stating that she had approached the Home Office with a suggestion that she should be allowed to demonstrate the blister fluid method to one or more of the prison doctors so that they might use it in cases of drug addicts sentenced to gaol but in reply was received that it was considered unnecessary to introduce any new methods of treatment in view of the fact that the prisoners were under their complete control so that there was no difficulty in depriving them of morphine.

An interesting discussion followed in which Drs ASTEN, MAHOMED, DIXON, GREEN and S A MONTGOMERY took part, and a hearty vote of thanks was accorded to Dr Vivian for her very interesting paper.

Treatment of Acute Delirium

Dr STEPHEN HORSLEY read a paper on 'The Treatment of Acute Delirium'. Dr Horsley said that delirium was a symptom-complex and might occur as a passing complication in many disorders including head injury, epilepsy, cardiovascular disease, alcoholism, drug poisoning and auto-intoxication. The characteristic symptoms were confusion with hallucinations, restlessness, and suspicion. There was always some physiological dysfunction such as tremors, tachycardia, pyrexia, and sleep was either absent or very deficient and without prompt treatment the extreme restlessness led to prostration which ended either in circulatory failure or in coma. The prognosis was always grave and every effort should be made to remove the patient at once to hospital. The therapeutic indications were to procure sleep and support metabolism. The choice of drugs was important and Dr Horsley thought it unwise to employ chloral or opium derivatives, and he favoured some of the newer derivatives of barbituric acid. He emphasized however that rest alone was likely to fail unless necessary active steps were taken to combat dehydration and toxæmia, this entailed administration of adequate amounts of fluid and he advocated administration of large quantities of saline or saline and glucose by the intravenous route. The daily hypodermic injection of one litre of Ringer Locke's solution was of greatest therapeutic value.

SOUTH WESTERN BRANCH TORQUAY DIVISION

The annual general meeting of the Torquay Division was held at Torbay Hospital on April 23 when Dr ERNEST WARD and later Dr D J BATTERHAM occupied the chair.

The following officers were elected

Chairman Dr Bitterham *Vice Chairman* Dr Annie Bryce
Honorary Secretary Dr R H Robinson *Honorary Auditor* Dr P A McCallum *Representative in Representative Body* Dr Ward
Deputy Representative in Representative Body Drs A E Carver and D Cronie *Charities Secretary* Dr R A Intey

The annual report of the Division was received and adopted and the thanks of the Division were conveyed to the honorary secretary for his work during the year. It was also agreed to send a copy of the annual report to each non member of the British Medical Association in the area of the Division with a covering letter drawing attention to the activities of the Division in particular and of the Association as a whole and emphasizing the advantages of membership, before the Annual Meeting of the Association at Plymouth in 1938.

A resolution was passed unanimously expressing the Division's wish to give active help and support to the Plymouth Division on the occasion of the Annual Meeting of the Association and recording the fact that the corporation of the borough of Torquay had intimated its desire to co operate.

SURREY BRANCH KINGSTON-ON-THAMES DIVISION

At the annual general meeting of the Kingston on Thames Division held at the Kingston and District Hospital on May 4 the annual report of the Division was adopted.

The following officers were elected for 1937-8

Chairman Dr J Ferguson *Vice-Chairman* Dr Helen Lukh
Honorary Secretary and Treasurer Dr Ralph G Smith *Charities Secretary* Dr A R C Dooley *Representatives in Representative Body* Drs Noel E Waterfield and Eleanor H Kelly *Deputy Representative in Representative Body* Dr D H Fulton

The Division's appreciation of the services of Dr A S Hollins as chairman during the past year and of Dr Lukh as honorary secretary and treasurer over a period was recorded. The meeting closed with a vote of thanks to the hospital authorities especially the nursing staff for providing accommodation for the monthly meetings of the Division during the past session.

SURREY BRANCH RICHMOND DIVISION

At the annual meeting of the Richmond Division held at the Richmond Royal Hospital on May 14 with Lieut-Colonel E L GOWLAND in the chair the following officers were elected for 1937-8

Chairman Dr D A Chamberlain *Vice Chairman* Dr D S Murray *Secretary and Treasurer* Dr R Duncan *Representative in Representative Body* Dr Isabelle W Horsley *Deputy Representative in Representative Body* Mr J W Heekes

A film on "The Science and Art of Obstetrics" was shown by the kindness of Petrolagar Laboratories Ltd. and was much appreciated. The CHAIRMAN proposed a vote of thanks to the representative of the firm and to the committee of the hospital for placing a room at the disposal of the Division and for hospitality. Lieut-Colonel E V HUGO proposed a vote of thanks to the retiring chairman, Colonel Gowland and this was heartily acclaimed.

YORKSHIRE BRANCH HUDDERSFIELD DIVISION

A meeting of the Huddersfield Division to which non members had been invited was held at Huddersfield on April 28 when Dr F GAMM was in the chair. Mr L DOUGAL CALLANDER, president of the Yorkshire Branch delivered a lecture on "Round the World in Fifty Minutes." His remarks were illustrated by lantern slides and the B M A World Tour Film.

On the motion of Dr W H SMALES seconded by Dr R S PARK, a hearty vote of thanks was accorded Mr Callander for his address.

POST-GRADUATE NEWS

The Fellowship of Medicine announces the following courses and demonstrations: tuberculosis demonstrations for M R C P candidates at Preston Hall, Maidstone, July 3; proctology at St Mark's Hospital, July 5 to 10; dermatology at Hospital for Diseases of the Skin, Blackfriars, SE, July 12 to 24; urology at All Saints Hospital, July 12 to 31; heart and lungs at Victoria Park Hospital, July 3 and 4; medicine and surgery at Miller General Hospital, July 10 and 11. Full particulars of all courses can be obtained from the Fellowship of Medicine, 1 Wimpole Street. W. Courses are open only to members of the Fellowship.

WEEKLY POST-GRADUATE DIARY

BRITISH POST-GRADUATE MEDICAL SCHOOL, Ducane Road, W.—
Daily, 10 a.m. to 4 p.m. Medical Clinics, Surgical Clinics and Operations, Obstetrical and Gynaecological Clinics and Operations. *Tues*, 4.30 p.m. Dr D Hunter, Occupational Diseases. *Wed*, 12 noon, Clinical and Pathological Conference (Medical). 2 p.m. Dr King, Carbohydrate Metabolism and Diabetes. 2 p.m. Clinical and Pathological Conference (Surgical). *Thurs*, 2.15 p.m. Dr Duncan, White Radiological Demonstration. 3 p.m. Operative Obstetrics. *Fri*, 3 p.m. Clinical and Pathological Conference (Obstetrics and Gynaecology).

ELLOWSHIP OF MEDICINE AND POST GRADUATE MEDICAL ASSOCIATION, 1 Wimpole Street, W.—*West End Hospital for Nervous Diseases*, Welbeck Street, W. Afternoon M R C P Course in Neurology. *Chelsea Hospital for Women*, Arthur Street, SW. All-day Course in Gynaecology. *City of London Hospital*, Victoria Park, E. *Wed* and *Fri*, 6 p.m. M R C P Course in Heart and Lung Diseases. *Brompton Hospital*, SW. *Tue* and *Wed*, 5 p.m. M R C P Course in Chest Diseases.

HOSPITAL FOR EPILEPSY AND PARALYSIS, Maida Vale, W.—*Thurs*, 3 p.m. Dr Blake Pritchard, Clinical Demonstration.

HOSPITAL FOR SICK CHILDREN, Great Ormond Street, W.C.—*Thurs*, 2 p.m. Clinical Lecture, Mr Eric J Lloyd, Spinal Deformities in Children. 3 p.m. Clinical Pathological Lecture, Dr A Signy, Interpretation of Faecal Bacteriology. Out-patient Clinics, mornings 10 a.m. to 12 noon. Ward Visits, afternoons 2 p.m. to 3.30 p.m.

INSTITUTE OF PATHOLOGY AND RESEARCH, St Mary's Hospital, W.—*Thurs*, 5 p.m. Dr W E Gye, Recent Work on Cancer.

ST PAUL'S HOSPITAL, Endell Street, W.C.—*Wed*, 4.30 p.m. Mr Jocelyn Swan, Growths in the Bladder.

SOUTH WEST LONDON POST-GRADUATE ASSOCIATION, St James' Hospital, Quekett Road, Balham, SW.—*Wed*, 12.40 p.m. Visit to Parke, Davis and Co. Hounslow.

TAVISTOCK CLINIC, Malet Place, W.C.—*Thurs*, 3 p.m. Dr H. Crichton Miller and 4.30 p.m. Dr Cedric Shaw, Summary of Introductory Course of Psychological Medicine for the General Practitioner.

DIARY OF SOCIETIES AND LECTURES

ROYAL SOCIETY OF MEDICINE

Section of Orthopaedics—Provincial meeting at Exeter, Sat., 145 p.m. Demonstration of cases at Princess Elizabeth Orthopaedic Hospital.

NATIONAL COUNCIL FOR MENTAL HYGIENE—At 26, Portland Place, W. *Thurs*, 3 p.m. Annual General Meeting, 4.30 p.m. Public Meeting. Speaker, Dr Henry Yellowlees.

NATIONAL TEMPERANCE HOSPITAL, Hampstead Road, N.W.—*Thurs*, 9 p.m. Twelfth Annual Macalister Lecture by Sir Arthur MacNalty, The Doctor in Politics and Diplomacy.

Naval, Military, and Air Force
Appointments

ROYAL NAVAL MEDICAL SERVICE

Surgeon Commanders A W Gunn to the *Hawkins*, A G Lee to the *Pembroke* for Royal Naval Barracks.

Surgeon Lieutenant Commanders J Cussen and T G B Crawford to be Surgeon Commanders.

Surgeon Lieutenant Commander V J Fielding has retired at his own request.

Surgeon Lieutenant Commanders D A Newbery to the *Pembroke* for Royal Naval Barracks (June 21) and to the *Sussex* on recommissioning. E E Malone to the *Shropshire*. R V Jones to the *Wellington*.

Surgeon Lieutenants D B Jack to the *Wildfire*, F W Baskerville to the *Pembroke* for Royal Naval Barracks (June 12) and to the *Sussex* on recommissioning. H O Connor to the *Inglefield*. F P Ellis to the *Victory* for Royal Naval Hospital Haslar. G H C R Critien to the *Resolution*. G R Rhodes to the *Rochester*. I C Macdonald to the *Falmouth*. G L Hardman. J F Meynell. W S Parker and W B Teasey to the *Victory* for Royal Naval Barracks.

ROYAL NAVAL VOLUNTEER RESERVE

Probationary Surgeon Lieutenant D R Maitland to be Surgeon Lieutenant.

ROYAL ARMY MEDICAL CORPS

Lieutenant J A G M Lynch to be Captain with seniority May 1, 1936. (Substituted for notification in the *London Gazette* of May 7, 1937).

The appointment of Lieutenant J A G M Lynch is antedated to May 1, 1935 under the provisions of Article 36 Royal Warrant for Pay and Promotion, 1931 but not to carry pay and allowances prior to May 1, 1936.

KING'S COLLEGE HOSPITAL Denmark Hill SE—Assistant Neurologist

KING'S LYNN WEST NORFOLK AND KING'S LYNN GENERAL HOSPITAL—H P Salary £125 p.a.

LANCASTER COUNTY MENTAL HOSPITAL—A M O (female unmarried) Salary £500 £25 £600 p.a.

LEWIS CITY—A R M O (male unmarried) for Killingbeck Sanatorium Salary £250 p.a.

LIVERPOOL ROYAL INFIRMARY—Locumtenent Pathologist (non resident) Salary £10 per week

LIVERPOOL CITY—A M O for Cleaver Sanatorium for Children Heswall Salary £300 p.a.

LIVERPOOL HAINEMANN HOSPITAL—R M O Salary £120 p.a.

LONDON CHEST HOSPITAL Victoria Park E—Assistant Tuberculosis Officer Salary £100 £25 £700 p.a.

MANCHESTER ANCOATS HOSPITAL—(1) C O (2) H S to the Ear Nose and Throat Department Salaries £250 p.a. and £100 p.a. respectively

MANCHESTER EAR HOSPITAL—R H S Salary £120 p.a.

MANCHESTER ROYAL INFIRMARY—Resident Clinical Pathologist (male) Salary £150 p.a.

MANCHESTER ROYAL MANCHESTER CHILDREN'S HOSPITAL—(1) R M O (unmarried) (2) R H S Salaries £150 p.a. and £100 p.a. respectively

MANCHESTER AND SALFORD HOSPITAL FOR SKIN DISEASES—H S Salary £150 p.a.

MANSFIELD AND DISTRICT GENERAL HOSPITAL—H S (male) Salary £150 p.a.

MENBOROUGH MONTAGU HOSPITAL—R H S (female) Salary £120 p.a.

MIDDLESBROUGH NORTH RIDING INFIRMARY—(1) Senior H S (2) Third H S Males unmarried Salaries £175 p.a. and £140 p.a.

MIDDLESEX COUNTY COUNCIL—(1) A M O and (2) J R A M O for North Middlesex County Hospital Edmonton Salaries £350 p.a. and £250 respectively (3) Visiting Dental S for West Middlesex County Hospital Isleworth Salary £2 2s per session

NATIONAL TEMPERANCE HOSPITAL Hampsstead Road NW—C O (male) Salary £120 p.a.

NORTHAMPTON GENERAL HOSPITAL—H S (male) Salary £150 p.a.

NORWICH NORFOLK AND NORWICH HOSPITAL—(1) General H S (2) H S to the Orthopaedic Department (3) C O Males unmarried Salaries £120 p.a. each

NOTTINGHAM GENERAL HOSPITAL—(1) H S for Ear Nose and Throat Department (2) R C O (male) Salaries £150 p.a. each

NOTTINGHAMSHIRE COUNTY COUNCIL—Assistant School M O (male) Salary £500 £25 £700 p.a.

NUNEATON GENERAL HOSPITAL—(1) R S O (2) H S Salaries £275 p.a. and £150 p.a. respectively

OLDHAM COUNTY BOROUGH—R A M O (unmarried) for the Municipal Hospital Salary £200 p.a.

PENSHURST CASSEL HOSPITAL FOR FUNCTIONAL NERVOUS DISORDERS—Medical Director (male) Salary £1,200-£1,500 p.a.

PLYMOUTH PRINCE OF WALES HOSPITAL Devonport—J H S Salary £120 p.a.

PLYMOUTH PRINCE OF WALES HOSPITAL Greenbank Road—(1) H S (2) H P Salaries £120 p.a. each

PONTERFRACT GENERAL INFIRMARY—J R M O (male unmarried) Salary £150 p.a.

PORT-OF-SPAIN CITY—Medical Officer of Health Salary £800 £25 £1,000 p.a.

PRESTON AND COUNTY OF LANCASTER ROYAL INFIRMARY—H S Salary £150 p.a.

PRINCESS LOUISE KENSINGTON HOSPITAL FOR CHILDREN St Quintin Avenue W—H S (male) Salary £120 £150 p.a.

QUEEN MARY'S HOSPITAL FOR THE EAST END E—(1) Casualty and Outpatient Officer (unmarried) Salary £150 p.a. (2) Surgical Anaesthetist Honorarium £52 10s p.a.

QUEEN'S HOSPITAL FOR CHILDREN Hackney Road E—Visiting Anaesthetist Fee £1 is per attendance

READING ROYAL BERKSHIRE HOSPITAL—C O (male) Salary £150 p.a.

ROTTERHAM HOSPITAL—H S to the Ophthalmic and Ear Nose and Throat Departments and to administer anaesthetics Salary £120 p.a.

ROYAL NATIONAL ORTHOPAEDIC HOSPITAL Great Portland Street W—Two H Ss (males unmarried) for the Brockley Hill Branch Stanmore Salaries £150 p.a. each

ROYAL WESTMINSTER OPHTHALMIC HOSPITAL Broad Street WC—Refraction Officers

ST GEORGE'S HOSPITAL, S.W.—Assistant P

ST MARY'S HOSPITAL W—Casualty H P Salary £150 p.a.

SCUNTHORPE AND DISTRICT WAR MEMORIAL HOSPITAL—S in charge of the Orthopaedic Department and Fracture Clinic Honorarium £200 p.a.

SHEFFIELD CHILDREN'S HOSPITAL—H S (male unmarried) Salary £100 p.a.

SHEFFIELD ROYAL INFIRMARY—C O Salary £150 p.a.

SHREWSBURY ROYAL SALOP INFIRMARY—R H S (male unmarried) Salary £160 p.a.

SOUTHWICK COUNTY BOROUGH—(1) Senior Assistant M O H Clinical Tuberculosis Officer and Deputy Medical Superintendent at St Chad's Hospital Male Salary £750-£937 10s p.a. (2) Assistant M O H and Assistant School M O (male unmarried) Salary £350 £25 £550 p.a.

SOMERSET COUNTY COUNCIL—A M O (male) Salary £500-£25 £700 p.a.

SOUTH EASTERN HOSPITAL FOR CHILDREN Sydenham SE—Two R M Os Honorariums £100 p.a. each

SOUTHAMPTON ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL—(1) C O (2) Resident Anaesthetist and H S for the Ear Nose and Throat Department Males unmarried Salaries £150 p.a. each

STOKES-ON-TRENT BURSLEM HAYWOOD AND TUNSTALL WAR MEMORIAL HOSPITAL—R H S Salary £175 p.a.

STOKES-ON-TRENT LONGTON HOSPITAL—H S Salary £160 p.a.

STOURBRIDGE CORRELY HOSPITAL—H S Salary £100 p.a.

SUNDERLAND ROYAL INFIRMARY—(1) R S O (male) (2) C O Salaries £250-£300 p.a. and £150 p.a. respectively

SWANSEA GENERAL AND EYE HOSPITAL—H S (male unmarried) Salary £150 p.a.

TUNBRIDGE WELLS KENT AND SUSSEX HOSPITAL—H S and C O Salary £150 p.a.

WARWICK WARWICKSHIRE AND COVENTRY JOINT COMMITTEE FOR TUBERCULOSIS—J A M O for King Edward VII Memorial Sanatorium Hertford Hill Salary £250 p.a.

WEIR HOSPITAL Grove Road Balham SW—J R M O (male unmarried) Salary £150 p.a.

WEST SUFFOLK COUNTY COUNCIL—County M O H and School M O Salary £1,000 p.a.

WESTMINSTER HOSPITAL Broad Sanctuary SW—Dental S

WILKINSON GENERAL HOSPITAL Harlesden Road NW—C O (unmarried) Salary £100 p.a.

WINCHESTER ROYAL HAMPSHIRE COUNTY HOSPITAL—H S (male) Salary £125 p.a.

WOLVERHAMPTON ROYAL HOSPITAL—Hon Assistant S and Hon Assistant Gynaecologist

WORKSOP VICTORIA HOSPITAL—Junior Resident Salary £130 p.a.

MEDICAL RETIREE UNDER THE WORKMEN'S COMPENSATION ACT 1925 for ophthalmic cases arising in the Sheriffdom of Lanark Applications to the Private Secretary Scottish Office Whitehall SW 1 by June 30

FLETCHER—On June 8 1937 at 587 London Road Glasgow Thomas M Fletcher M.B. Ch.B.

in those patients with symmetrical lesions especially of the extremities and in those having typical visomotor disturbances

HEALTH INDICES

An endeavour to rationalize the presentation of material for use in the preparation of statistics relative to health has recently been described under the title of 'Health Indices'. There is, the authors of the article state, increasing recognition of the fact that mortality figures by themselves even where authoritative are not a complete criterion of the healthiness or unhealthiness of a community. Other relationships which have been adduced as bearing obviously on the question have so far been applied for the most part in investigations of limited range and the need is felt for a system at once more flexible and comprehensive which could function if not in every possible case at least in a wider field. The working out of the system here presented which aspires to meet these requirements, originated at Geneva but was later transferred to the United States in order to benefit by the experience already accumulated in that country in the matter of health surveys. Pioneer studies had been made there by Dr John S. Billings while chairman of a committee of the American Public Health Association. His schedule of the topics which he regarded as possessing significance was broadly based, well founded and far ahead of contemporary opinion. But in more recent times his aims appear to have been largely lost sight of and his ideals narrowed down to the production of rating sheets or appraisal forms equipped with which duly filled in cities and counties have courted applause in 'health conservation contests'. While these contests served the undoubtedly useful purpose of stimulating community interest in health the points which they stressed had too little reference to the basic criteria of healthiness. The new system of health indices does not omit the essentials. As presented it is composed of three main divisions: (A) indices of vitality and health (B) indices of environment and (C) indices of administrative activity. The categories of division A are population, natality, still births, infant and maternal mortality, general mortality and causes of death, morbidity, invalidity, insanity and mental defects, alcoholism and drug habit, accidents, suicides and homicides and examinations of physical fitness. The categories of division B, environment, are climate, topography and density of population, occupation, distribution of wealth, cultural level, illegitimacy and prostitution, housing, nutrition and consumption of alcoholic beverages etc. The categories of division C, indices of administrative activity, are community expenditures on sickness and public health, sanitary personnel, vital statistics, laboratory services, acute communicable diseases, venereal diseases, tuberculosis, other diseases, general public health, nursing, maternity, hygiene, infant and pre school hygiene, school hygiene, physical education, general sanitation, food inspection and nutrition, housing, industrial hygiene, health instruction, care of the insane and feeble minded, hospital

facilities, health insurance, free medical assistance in old age, care and cure of the aged. The completion of the full list of items under all the forty-four categories for a large and well organized city is a task of some magnitude even allowing for the circumstance that all the items may not figure in every area. For routine use in a handy list of a hundred indices is offered. For initiating comparative studies of a number of communities there is added a short list of sixty indices. The use of the indices is exemplified by a study of the city of New Haven, Connecticut. The compilation naturally bears the stamp of transatlantic usage and health organization but the indices properly handled and where necessary adjusted so as to fit in with local conditions should serve to elicit in any country numerical data in a form amenable to statistical treatment.

CHEMICAL PROPERTIES AND PHARMACOLOGICAL ACTION

The correlation of pharmacological action and therapeutic effects with chemical constitution and physico-chemical properties has attracted many workers but hitherto progress has lagged. The similarity of effects of substances of vastly different chemical structure and the great complexity of the organs and tissues upon which they appear to act make the problem difficult of solution from the start. The absence of any unitary hypothesis renders the production of therapeutically active synthetic compounds a tedious business and there seems nothing for it but to test innumerable compounds with the hope that somehow an active one will be hit upon. When an active body is discovered little if any reason is found for its activity and it often happens that slight modification of the molecule produces a change in activity out of all proportion to the apparent significance of the change in chemical structure. In certain fields empirical rules have been evolved which give a rough guide for the synthesis of new agents—e.g. in the field of anaesthetics where a criterion to be followed is lipid solubility—but in the main good fortune plays a predominant part. When we consider as Starkenstein¹ points out the infinite possibilities of reaction between the molecules of protein, carbohydrates, fats and sterols and organometallic and dissociated inorganic combinations in the cell then the problem can be more clearly defined. But the constant proximity in protoplasm of oxidation and reduction of formation and neutralization of acid and alkaline valencies must be associated with biological events of which we can only be dimly aware. Even when as in the case of hypnotics, narcotics, local anaesthetics and organic arsenicals relations are known between constitution and effect reliance must still be placed upon demonstrable pharmacological action and not upon chemical properties. Examining the similar problem of toxicological action Starkenstein notes that whereas so many pharmacological agents can bring about acute toxic effects only few lead to chronic poisoning. This he finds true not only for complicated organic compounds of high molecular weight but also

¹ *Quart. Bull. Illth. Org. L. O. N.* 1936, 5, 901.

² *Klin. Wschr.* 1936, 15, 1865.

for simple elements and inorganic compounds. A series of investigations made him conclude that only those substances can lead to chronic poisoning which exert a paralytic action in the organism. Poisons on the other hand, which only act in the direction of stimulation appear never to produce chronic poisoning. Applying these conceptions to the elements arranged in the periodic system Starkenstein finds that only the following elements are capable of producing chronic intoxication: mercury, thallium, lead, bismuth, phosphorus, arsenic, antimony, manganese and radium emanation. All these elements except manganese fall either into group 5 (sub group b) or period VI of the periodic table. The precise significance of this fact is not immediately obvious but it led Furth to examine the physical properties of the elements mentioned. Most of these he found to be supraconductors—i.e. their electrical resistance suddenly disappeared at certain temperatures. This led to further investigation of the physical properties of the elements with the object of further correlation with pharmacological action. It was found that the ratio of the melting point (absolute) to the density expressed some characteristic property. If the elements are arranged in ascending order of this ratio he found that those which can produce chronic toxicity appear mainly at the head of the table with the lowest values. This was not the case for all the elements mentioned above but the exceptions (As, Sb, P, Mn) had the property of forming alloys which also gave very low values for the ratio investigated. Since the elements which cause chronic poisoning exert their influence when brought into the organism as such Starkenstein and Furth suggest that some significance must lie in the demonstrated facts that they are supraconductors on the one hand and have low MP/density ratios on the other.

QUEEN'S INSTITUTE OF DISTRICT NURSING

The jubilee of the institute was commemorated on Wednesday June 16 when Her Majesty Queen Mary, its Patron, inspected at Buckingham Palace over 2000 Queen's nurses and awarded badges to those who had qualified for them. In 1887 Queen Victoria gave £70 000 part of the Women's Jubilee Offering, to found the institute. She became its Patron Queen Alexandra followed her. On her death £233 000 was raised for the institute as a memorial to her. She was followed by Queen Mary the present Patron. The institute prepares nurses who have received full hospital training for the special work of district nursing. It ensures by a system of inspection that their work shall be kept up to a high standard. It provides district nurses for England, Scotland, Wales and Ireland. The magnitude of the task is shown by the fact that about fifteen million visits are paid yearly to patients in their own homes by some 7000 nurses which works out at 50,000 visits a day. The institute's nurses attend nearly 69,000 cases of midwifery yearly; the mortality rate of these is 2.58 per thousand. The institute is celebrating its jubilee by raising funds to enable it to train more nurses and to help the local District Nursing Associations to raise funds to pay for and suitably house as many Queen's

nurses as are required for each district. Medical practitioners who know full well the value of district nurses will no doubt use their influence in support of the jubilee appeal.

BLOOD GROUPING OF THE BANTU

The art of investigating blood groups has been of valuable assistance to the ethnologist. Few nations especially primitive ones, know much about their own history, and what they do know is often distorted by legend. The language of a race may disappear through the imposition of the language of a conqueror. The anthropologist may easily lose himself in a multitude of measurable characteristics. Blood grouping alone can show the exact proportion of blood introduced by invaders into an invaded people of a different group coefficient. The literature on the blood group characteristics of various races is enormous, but much work can still be done with benefit to ethnology provided that the results are accessible and properly classified. One of the latest population studies is a thesis on the grouping of 5000 Bantu of different races by R. Elsdon-Dew of the South African Institute for Medical Research, Johannesburg.¹ He found that the Bantu are not homogeneous from a serological point of view but their position on the diagram by which it is customary to show the serological characteristics of a people indicates a more primitive distribution of the blood groups than that found in any other black race for which the figures are available. He concludes that the Bantu are the most primitive black race known, and that the negroes are the result of a mixture of Bantu with some other stock such as the Egyptian. They must he thinks have separated from the main mass of mankind before the characteristics A and B appeared. Anthropologists have already indicated that the Bantu are predominantly of negro origin with a lesser proportion of Caucasian blood. If this is true then the other progenitor of the Bantu must have had even less A and less B than they and, if the proportion of Caucasian blood is more than a trace, must have stood very near the origin of the diagram the point where there are no A or B characteristics in a race at all. Serologically, the Hottentots are predominantly Caucasian but, either alone or with the Bushmen, they could not have drawn the Bantu from the origin to their present position for, if they had then the Bantu would be for the most part Hottentot-Bushman. On the other hand, intermixture with the Caucasian races could have given the Bantu their present place, and so the serological findings confirm those of anthropology, linguistics and cultural studies. The tentative reconstruction which Dr. Elsdon-Dew suggests is that at some early date Africa was inhabited only by a black race probably living near the West Coast, and having O as their sole blood group. Then the country was invaded by a light-skinned small race bearing the factors O and A only. These people probably did not come into contact at this stage with the black inhabitants but moved south founding the race of Bushmen. Next came the invasion of a taller light-skinned race bearing again only the factors O and

¹ Publ. S. Afr. Inst. med. Res. 1936 No. 39, 7, 217.

A They remained in the north and formed the progenitors of the present Herbers. Finally, after having all the blood groups mixed and spread throughout Africa a part of them moving down to Central Africa pushing the Bushmen further south. The modern representatives of this race are the Hottentot. At this stage the black race still unaffected to any great extent by factors A and B moved south with the Hottentot and the Bushmen in front while further invasions of completely grouped races behind affected those left in West Africa and the rearward of the black horde. This interesting conjecture is of course subject to revision in the light of further experience but it is obviously based on prolonged skilled and careful research. Incidentally Dr. Elsdon Dew's thesis gives one of the clearest summaries of the elements of blood grouping that has yet appeared.

AN UNUSUAL PITUITARY SYNDROME

Since Simmonds described in 1914 the syndrome produced by destruction of the anterior lobe of the pituitary further confirmation of the widespread influence of this gland has been obtained especially during the last decade. The possible relationship direct or indirect, of the anterior pituitary and blood formation has so far not attracted a great deal of attention. I. Snapper, J. Groen, D. Hunter and L. J. Witts¹ now describe a remarkable syndrome of anterior pituitary and gonadal insufficiency associated with achlorhydria, anaemia, and subacute combined degeneration of the cord. They present six patients four men and two women, between the ages of 42 and 58, all of whom had had symptoms of anterior pituitary insufficiency for a number of years and one of whom had signs of a chromophobe adenoma. Insufficiency of the gonads considered to be secondary to hypopituitarism was shown in these patients by lack of physical vigour and sexual interest or desire, amenorrhoea and in two cases by small size and imperfect descent of the testes. The facies was dull and expressionless, the movements lethargic, sexual hair was absent and the hair of the scalp and eyebrows was scanty or absent. The basal metabolic rate in the four patients in whom it was estimated under suitable conditions was considerably depressed but there was no reason to believe that they were suffering from true myxoedema. The skin was soft moist and elastic, there was no subcutaneous oedema, the appearance of the patients bore no resemblance to that of a patient with myxoedema, and the basal metabolic rate unlike that of myxoedema was raised by the administration of thyrotropic hormone. All the patients had hypochlorhydria and five complete achlorhydria. Anaemia developed relatively late in the course of the disease. In three there were symptoms of subacute combined degeneration of the cord, in one the anaemia was hypochromic and responded to iron and in two it was of the Addisonian type and responded to liver treatment. The authors consider that the anaemia was essentially gastrogenous and hence an indirect effect of insufficiency of the anterior lobe of the pituitary. They

postulate that anterior pituitary deficiency is followed by achlorhydria and that the achlorhydria may induce later a long interval in iron-deficiency anaemia, a hyper-deficiency anaemia, subacute combined degeneration of the cord or a combination of these conditions.

PREVENTION OF URINARY CALCULI

In patients who suffer from some disease of bone needing prolonged immobilization and who at the same time have retention and infection of urine the presence of calculi in the urinary tract is an unpleasant and not infrequent complication from which every effort should be made to guard them. The patient undergoing prolonged orthopaedic treatment needs protection from this complication just as elderly immobilized patients do from hypostatic pneumonia. The urinary problem has recently been studied by Higgins and Schlumberger¹ of Cleveland who point out that in patients undergoing orthopaedic treatment several of the known aetiological factors associated with the formation of urinary calculi are aggravated either by their disease or by its treatment. These factors are infection (either local or focal), stasis, hyperparathyroidism, nutrition deficiency and phosphaturia. Investigations have shown the great importance in these immobilized orthopaedic cases of the nature of the diet and the reaction of the urine—two factors intimately related. Diet however is of more importance than its effect on the hydrogen ion content of the urine because it is known that adequate amounts of vitamin A are necessary to maintain the integrity of epithelial structures. When a deficiency of vitamin A exists stratification of the transitional epithelium of the bladder, ureters and renal pelvis occurs and this change apparently favours the formation of calculi. As the calculi in these orthopaedic cases are found to consist of phosphates and carbonates of calcium and magnesium it is important to prevent the precipitation of these salts. The urinary reaction should therefore be kept on the acid side (pH of 5 to 5.2) by an appropriate diet with a high vitamin content and if necessary also by the use of acidifying agents such as ammonium chloride. Details of suitable acid forming and high vitamin diets are given in Higgins and Schlumberger's paper which may profitably be consulted by those who have to treat these patients. It is important to examine the urine frequently in all recumbent orthopaedic cases to give an appropriate diet and as a safeguard to make an x-ray examination before their discharge from hospital in order to rule out the possibility of a silent renal calculus.

The King has nominated Sir Arthur MacNalty to be for five years a member of the General Council of Medical Education and Registration in the United Kingdom, in succession to Sir Henry Dale.

Queen Mary will open the new medical block, King George V Building at St Bartholomew's Hospital on Thursday July 8 at 3 p.m.

WORK OF THE LISTER INSTITUTE

ANNUAL REPORT

The Lister Institute of Preventive Medicine published on June 2 its forty third annual report reviewing the work done during the past year. The Governing Body records with regret the deaths of Professor E. H. Kettle who had been a member since 1931, and of Dr F. W. Alexander, who had been connected with the Institute for nearly forty years. We give here a short summary of some of the work recorded in the report, which may profitably be studied at greater length.

Virus Studies

Dr M. H. Salaman has compared the serological properties of the elementary bodies of vaccinia virus with those of the soluble antigen of the virus which can pass through filters that retain the bodies. He has shown that the virus neutralizing power of an anti-vaccinal serum can be removed by absorption with a sufficient dose of washed elementary bodies, but not by absorption even with large doses of the soluble antigen. Dr Hurst, by passing the filterable virus of rabbit myxomatosis through the brains of rabbits for several generations has obtained a variant which, inoculated into skin areas generally failed to produce death though local and generalized lesions persisted. The discovery of this variant should facilitate research into the relation between myxoma and fibroma, as it will now be possible to study animals that have recovered from myxoma without having to give them the fibroma virus first. Sir John Ledingham has shown that animals infected with fibroma virus and particularly with the 'inflammatory' variant, develop agglutinins for myxoma but often little or none for fibroma until a dose of myxoma virus is given, when agglutinins for both appear in the serum.

Dr C. R. Amies's further researches have confirmed the fact that fowls with a Rous sarcoma develop anti-bodies for the Rous No. 1 sarcoma agent, prepared by repeated high speed centrifugation of cell-free tumour extracts. It was found, too, that the sera of rabbits hyper-immunized with normal fowl protein showed strong neutralizing activity against these purified suspensions of the Rous No. 1 agent. It would appear that fowl protein may be one of the antigenic constituents of the tumour agent.

Serological Studies

The work of Dr A. Felix and Miss R. M. Pitt strengthens an earlier conclusion that only strains of *S. typhi* containing both "O" and "Vi" antigen possess the highest degree of virulence of which *S. typhi* is capable. Many attempts to prepare an antityphoid vaccine which would enable the "Vi" antigen to be preserved in its most effective form have been unsuccessful. With Dr W. D. Nicol, Dr Felix tested the antibody response of fifty persons who had been given subcutaneously three doses of an alcohol-killed typhoid vaccine. All those inoculated showed a marked increase in "O" antibody and in half there was a significant increase in the "Vi" antibody. The results of an examination of sera from forty-five typhoid carriers suggest that "Vi" agglutination should have a definite place in the routine diagnosis of typhoid carriers. Each of the twenty-five strains from chronic typhoid carriers was found to contain "Vi" antigen.

Dr F. A. Gorer, who with Dr Schütze has been investigating the influence of genetic constitution on immunity and immune processes, found that sarcoma arising in a pure line of albino mice was transferable to all other members of the line and certain hybrids derived from it but not to unrelated mice. Those hybrids susceptible to grafts of the tumour possessed an antigen in their erythrocytes derived from the albino ancestors. In the absence of the antigen the tumour invariably regressed.

Endocrinology

One of the most remarkable properties of the sex hormones is that of stimulating the development of the sexual organs of both sexes in normal rats and bringing about a return of the atrophied organs of gonadectomized animals to, or towards, the normal condition. Dr V. Korenchevsky, with Mrs M. Dennison and Miss K. Hall has studied the effect on male and female rats of various combinations of the male hormones trans-dehydroandrostosterone and testosterone propionate and also of the probable intermediate compounds in the biological formation of sex hormones. The effect of various combinations of these hormones with oestrone was also investigated. They found testosterone propionate the most powerful of this group, and showed that in appropriate doses it brings about a return to the normal condition of the atrophied sexual organs in castrated male rats and a return to nearly normal weight of the sexual organs in ovariectomized rats. That these hormones are still essentially male however, is shown by the fact that their restorative effect on all the sexual organs of the male rat is complete, whereas the complete effect was obtained in females only when testosterone propionate was administered simultaneously with the female hormone (oestrone). Complete recovery of all the atrophied sexual organs with oestrone alone was not possible. These results suggest a possible reason for the simultaneous presence of "male" and "female" hormones in the organism of either sex.

Unlike the other male hormones testosterone propionate continues to stimulate, though with a slowly decreasing action, the sexual organs for as long as nine days after the last injection. During this period it maintains its effect on the adrenals while the katabolic effect, as shown by changes in body weight, even increases. This property is therapeutically valuable in that results can be obtained with injections as infrequent as once in ten or even perhaps fourteen days.

Professor P. Ellinger and Dr A. Lambrechts, studying the localization of the glycosuric action of phloridzin have shown that it interferes with the passage of certain substances from the lumen into the epithelium of the proximal tubules. The mechanism of this blockade has, however, not yet been ascertained.

Professor Ellinger, in collaboration with Dr Dorothy Hare and Dr S. Levy Simpson, has investigated the influence of the cerebrospinal fluid of an acromegalic woman on the urinary chloride and water excretion of rabbits injected subcutaneously with the fluid and given water by the mouth simultaneously. A definite increased rate of chloride elimination resulted, but normal water diuresis was unaffected. Cerebrospinal fluid from normal people and sera from the acromegalic patient and other control patients had no action either on chloride excretion or on diuresis. This effect was less after irradiation of the pituitary gland, which also produced clinical improvement. In control experiments a standard solution of pitressin had an anti-diuretic action and increased the rate of chloride excretion. It has not been possible to decide whether the anti-diuretic and chloride-eliminating effects are due to different hormones or whether the anti-diuretic action of the posterior lobe hormone was masked by that of some other substance in the spinal fluid of this patient.

Nutrition

A comparison of the results of biological and spectrographic estimations of vitamin A has been conducted by Miss Hume in order to obtain trustworthy figures for the conversion factor required for relation of the results of the biological and spectrographic tests and expression of the latter in international units. If certain reported discrepancies cannot be resolved it is possible that the spectrographic method will be abandoned and vitamin A standardization made to depend only on the biological test.

At the Department of Animal Pathology, Cambridge, Dr H Chick has collaborated with Dr T A Birch and Sir Charles Martin in an investigation of the nutritive defects of maize. A diet containing over 80 per cent ground whole white maize supplemented with permeal and a small amount of purified casein, extra salts and cod liver oil was given to young pigs. After about six weeks on this diet they lost weight, became anorectic, suffered from severe diarrhoea and died unless the diet was changed. The disease was prevented if 4 per cent yeast was included or if the maize was replaced by a mixture of wheat and barley. It was cured in a dramatic manner when yeast or an autoclaved protein free yeast extract was added to the diet. These facts point to a deficiency in maize of some heat stable constituent in the yeast extract—that is some constituent of vitamin B. Dogs given the above diet develop the condition known as nutritional black tongue which many believe to be analogous to human pellagra.

Miss A M Copping has continued the investigation begun by Dr M H Rosecoe in 1935 on the vitamin B₁ and B contents of wholemeal flour and bread and found them to be much greater than those of white flour and bread. The last two, however, proved unexpectedly rich in vitamin B₂ and the amount in the bread was not to be attributed to the added yeast since the values for the flour and the bread were equal. The content of flavine was low in both types of flour and bread and the second constituent of the vitamin B complex (so called vitamin B₂) was abundantly present in the wholemeal flour and bread but less in the white flour and bread.

Dr T F Macrae and Miss C F Edgar have shown that aqueous yeast extracts contain two factors in addition to vitamin B₁ and lactoflavine necessary for the growth of rats. One of these factors is removed with lactoflavine from the yeast extracts by adsorption with fuller's earth in acid solution while the other remains in the fuller's earth filtrate. The factor adsorbed by fuller's earth may be eluted with barium hydroxide. They have been working on the chemistry and purification of the factor which is not adsorbed by fuller's earth. The results obtained suggest that this vitamin may be quite distinct from vitamin B₂ as described by György.

Dr S S Zilva has studied the relation of the intake of ascorbic acid to the vitamin C content of the selective organs and other tissues of guinea pigs to their susceptibility to scurvy, to the urinary excretion of ascorbic acid, and to their general well being. He found that in order to attain the maximum concentration in the tissues ten times the protective dose had to be given. The accumulated vitamin C in the body of the guinea pig does not act as a store in the true sense of the word. The results support the view that there is a wide margin of unsaturation with vitamin C which has no obvious detrimental effect on the health of the individual. Dr Johnson found that guinea pigs deprived of vitamin C did not develop cataract. The humours of the eye and the lens behaved like the selective tissues: the vitamin disappeared during dietetic depletion and reappeared in the original concentration when ascorbic acid was injected into the animals.

Biochemistry

Dr A R Todd and Dr F Bergel have finally synthesized ancurin (vitamin B₁₂). The synthetic product was identified with the natural vitamin by chemical and biological methods and synthesis of related compounds has been undertaken with a view to determination of the structural features essential for antineuritic activity. Dr Todd has also done some preliminary work in an attempt to isolate the sterility factor in vitamin E in the unsaponifiable fraction of rice and oil.

Therapeutic Sera and Vaccines

Dr W T J Morgan has elaborated a method for the isolation of the antigen of *B dysenteriae* Shiga and

describes the antigen in its natural state as a polysaccharide-lipoid complex representing about 50 per cent of the antigenic complex. The method he uses has been applied to other bacteria.

Dr G I Pettie has confirmed the fact that an inoculum containing comparatively few living meningococci suspended in a solution of mucin is lethal to mice by intraperitoneal injection. The relative virulence of meningococcal strains can now be estimated without difficulty by means of the mucin technique.

Other work has seemed to show that the addition of 50 to 60 per cent of glycerin to tetanus toxin has a remarkable stabilizing action on it and within recent years the same principle has been extended to the toxin of *C. welchii* and to dysentery toxin (Shiga). Glycerinated preparations of this kind can be stored at -30°C—a temperature which is not sufficient to freeze them but which retards internal chemical and enzymic changes and thus inhibits destruction of the specific molecules. Further general work on the stability of therapeutics has been continued.

BRITISH ASSOCIATION OF RADIOLOGISTS

THIRD ANNUAL MEETING

The third annual meeting of the British Association of Radiologists was held in London on June 11 and 12 under the presidency of Professor J M WOODFORD MORRISON. Two sessions were held, one of them devoted to radiotherapy and the other to radio-diagnosis and both attracted large attendances.

A brief lecture on the after-care of patients suffering from breast cancer was delivered by Dr I HERMANSON JOHNSON. He described the objects of such after-care as being to keep the patient free from the external signs of the disease, to avert pain and discomfort, to prevent or delay the onset of metastases, to recognize and treat at the earliest possible moment any metastases that occur, and to ensure that the patient's psychological reactions are as normal as possible. In his experience the mental state of those who knew they were suffering from cancer was far better than those who merely suspected it. The patient-to-day had a more philosophical outlook on life and death than his predecessors and of course however depressing mortality statistics might be they related to the average not to the individual and did not prevent the possibility of miracles. He urged the creation of special after-care clinics for such cases in hospital districts.

Wave-length in Radiotherapy

The controversy regarding wave length as a factor in radiotherapy was opened by Dr G I STANNING who suggested that there was a selective action in rays of shorter wave length (that is, rays having greater penetrating power). There was not only clinical but laboratory evidence to that effect. The distance so to speak between damage to the skin and damage to the growth was much greater with the short wave than with the long wave. He agreed that the selective action of the shorter waves was only one factor concerned, but it made a decisive difference in radio resistant tumours.

Dr J H DOUGLAS WEBSTER took a different view. He regarded wave length as one of the least important factors in radiotherapy. The evidence for selective action of the short wave was extremely tenuous. There was of course a better depth dose with higher voltage but the same result could be obtained by using the tube at a greater distance. Differences in results were due to variations in intensity and time, not to wave length as such. Dr RALSTON PATERSON said that at the present time it was easier and more successful to treat cases with shorter wave length, but more important than any specificity difference was the factor of skin reaction. The skin reaction dose for dose, varied with difference of wave length but he believed that the effect was a physical not a biological one. If the skin had a greater tolerance for shorter wave

WORK OF THE LISTER INSTITUTE

ANNUAL REPORT

The Lister Institute of Preventive Medicine published on June 2 its forty third annual report reviewing the work done during the past year. The Governing Body records with regret the deaths of Professor E. H. Kettle who had been a member since 1931, and of Dr F. W. Alexander, who had been connected with the Institute for nearly forty years. We give here a short summary of some of the work recorded in the report, which may profitably be studied at greater length.

Virus Studies

Dr M. H. Salaman has compared the serological properties of the elementary bodies of vaccinia virus with those of the soluble antigen of the virus which can pass through filters that retain the bodies. He has shown that the virus neutralizing power of an anti-vaccinal serum can be removed by absorption with a sufficient dose of washed elementary bodies, but not by absorption even with large doses of the soluble antigen. Dr Hurst, by passing the filterable virus of rabbit myxomatosis through the brains of rabbits for several generations has obtained a variant which, inoculated into skin areas, generally failed to produce death, though local and generalized lesions persisted. The discovery of this variant should facilitate research into the relation between myxoma and fibroma, as it will now be possible to study animals that have recovered from myxoma without having to give them the fibroma virus first. Sir John Ledingham has shown that animals infected with fibroma virus and particularly with the "inflammatory" variant, develop agglutinins for myxoma but often little or none for fibroma until a dose of myxoma virus is given, when agglutinins for both appear in the serum.

Dr C. R. Amies's further researches have confirmed the fact that fowls with a Rous sarcoma develop anti bodies for the Rous No. 1 sarcoma agent, prepared by repeated high speed centrifugation of cell free tumour extracts. It was found too, that the sera of rabbits hyper-immunized with normal fowl protein showed strong neutralizing activity against these purified suspensions of the Rous No. 1 agent. It would appear that fowl protein may be one of the antigenic constituents of the tumour agent.

Serological Studies

The work of Dr A. Felix and Miss R. M. Pitt strengthens an earlier conclusion that only strains of *S. typhi* containing both "O" and "Vi" antigen possess the highest degree of virulence of which *S. typhi* is capable. Many attempts to prepare an antityphoid vaccine which would enable the "Vi" antigen to be preserved in its most effective form have been unsuccessful. With Dr W. D. Nicol, Dr Felix tested the antibody response of fifty persons who had been given subcutaneously three doses of an alcohol-killed typhoid vaccine. All those inoculated showed a marked increase in O antibody, and in half there was a significant increase in the Vi antibody. The results of an examination of sera from forty-five typhoid carriers suggest that "Vi" agglutination should have a definite place in the routine diagnosis of typhoid carriers. Each of the twenty-five strains from chronic typhoid carriers was found to contain Vi antigen.

Dr P. A. Gorer, who with Dr Schütze has been investigating the influence of genetic constitution on immunity and immune processes found that sarcoma arising in a pure line of albino mice was transferable to all other members of the line and certain hybrids derived from it but not to unrelated mice. Those hybrids susceptible to grafts of the tumour possessed an antigen in their erythrocytes derived from the albino ancestors. In the absence of the antigen the tumour invariably regressed.

Endocrinology

One of the most remarkable properties of the sex hormones is that of stimulating the development of the sexual organs of both sexes in normal rats and bringing about a return of the atrophied organs of gonadectomized animals to, or towards, the normal condition. Dr V. Korenchevsky, with Mrs M. Dennison and Miss K. Hall, has studied the effect on male and female rats of various combinations of the male hormones trans dehydroandrosterone and testosterone propionate and also of the probable intermediate compounds in the biological formation of sex hormones. The effect of various combinations of these hormones with oestrone was also investigated. They found testosterone propionate the most powerful of this group, and showed that in appropriate doses it brings about a return to the normal condition of the atrophied sexual organs in castrated male rats and a return to nearly normal weight of the sexual organs in ovariectomized rats. That these hormones are still essentially male, however, is shown by the fact that their restorative effect on all the sexual organs of the male rat is complete, whereas the complete effect was obtained in females only when testosterone propionate was administered simultaneously with the female hormone (oestrone). Complete recovery of all the atrophied sexual organs with oestrone alone was not possible. These results suggest a possible reason for the simultaneous presence of "male" and "female" hormones in the organism of either sex.

Unlike the other male hormones testosterone propionate continues to stimulate, though with a slowly decreasing action, the sexual organs for as long as nine days after the last injection. During this period it maintains its effect on the adrenals, while the katabolic effect, as shown by changes in body weight, even increases. This property is therapeutically valuable in that results can be obtained with injections as infrequent as once in ten or even perhaps fourteen days.

Professor P. Ellinger and Dr A. Lambrechts studying the localization of the glycosuric action of phloridzin, have shown that it interferes with the passage of certain substances from the lumen into the epithelium of the proximal tubules. The mechanism of this blockade has, however, not yet been ascertained.

Professor Ellinger, in collaboration with Dr Dorothy Hare and Dr S. Levy Simpson, has investigated the influence of the cerebro-spinal fluid of an acromegalic woman on the urinary chloride and water excretion of rabbits injected subcutaneously with the fluid and given water by the mouth simultaneously. A definite increased rate of chloride elimination resulted, but normal water diuresis was unaffected. Cerebro-spinal fluid from normal people and sera from the acromegalic patient and other control patients had no action either on chloride excretion or on diuresis. This effect was less after irradiation of the pituitary gland, which also produced clinical improvement. In control experiments a standard solution of pitressin had an anti-diuretic action and increased the rate of chloride excretion. It has not been possible to decide whether the anti-diuretic and chloride eliminating effects are due to different hormones or whether the anti-diuretic action of the posterior lobe hormone was masked by that of some other substance in the spinal fluid of this patient.

Nutrition

A comparison of the results of biological and spectrographic estimations of vitamin A has been conducted by Miss Hume in order to obtain trustworthy figures for the conversion factor required for relation of the results of the biological and spectrographic tests and expression of the latter in international units. If certain reported discrepancies cannot be resolved it is possible that the spectrographic method will be abandoned and vitamin A standardization made to depend only on the biological test.

lengths the whole explanation of the clinical differences lay in that fact

Low Voltage Near-distance X-Ray Therapy

Brief contributions were made by Professor WOODBURN MORISON Dr J F BROWLEY and Dr S B ADAMS on low voltage near-distance x-ray therapy. Dr Adams described results as elicited at the Royal Cancer Hospital where the method had been employed for two years. The most suitable conditions for treatment by this method were skin cancer cases. Very little inter-cavity work was done. Cases of malignant disease of the tongue and tonsil being treated by 'bomb' therapy. Certain nodular types of breast cancer were suitable, and among non-malignant conditions treated with success were boils, lupus, moles, and warts. Keloid scars responded well.

The second session was devoted to radio diagnosis. Dr E LYSIOLM of Stockholm gave an address on experiences in ventriculography based on over 600 cases submitted to this procedure generally with lipiodol and described the localization of the various brain tumours. It was explained that all the neuro-radiological work in Sweden was concentrated in one clinic, of which Dr Lysiolm had charge. Dr H W A POST read a paper on salpingography—the radiological examination of the uterus and Fallopian tubes by means of lipiodol or other iodized oil. Other papers were read by Dr E ROHAN WILLIAMS on urography in pregnancy, by Dr H M WORTH on the use of lipiodol in the localization of spinal tumours, and by Dr M H JURE on cases of suprarenal tumour.

Annual Dinner

The annual dinner of the Association was held on June 11 under the presidency of Professor J M WOODBURN MORISON. In proposing the health of the Association Mr S J WORSLEY acting principal of the University of London referred to the fact that the University had instituted what he thought was the only chair of radiology in this country—the one at present filled by Professor Morison. It had also instituted a diploma in radiology, a step not taken without some difficulty. It was inevitable that a university so placed in relation to medicine as London must take steps to put radiology on a proper footing. Already eight schools of the University were prepared to give instruction in some part of the course, though actually at present the burden was being borne by two. In 1936 twelve students passed the second part of the examination for the diploma—a small but promising beginning. Dr R M BEATH of Belfast, in responding, thanked the members for making him president-elect, which he considered a tribute to Irish radiology. He referred to the sound work done by his three predecessors in the chair—Dr F J Brailsford, one of the prime movers in the formation of the Association and Dr R S Paterson and Professor Woodburn Morison who had guided it on sound lines. The main motive of the Association was the training and education of the radiologist. It was moving for a higher diploma, and hoped at some time to form a college of radiology.

Dr R E ROBERTS proposed the health of the guests who included Sir Cuthbert Wallace, President of the Royal College of Surgeons, Sir Walter Langdon Brown, Mr Rock Carling, Mr Dickson Wright, and representatives of the *Lancet* and the *British Medical Journal*. Sir WALTER LANGDON BROWN in responding suggested as a motto for radiologists the latter part of Burke's aphorism, 'What shadows we pursue! or St Paul's, Now we see through a glass darkly.' He referred to the great differences which modern scientific apparatus had made in the practice of medicine and recalled a remark of his old chief Samuel Gee, 'Formerly the diagnosis of renal calculus required a good deal of skill, now it will require no skill at all, but at any rate we shall have certainty.' Professor WOODBURN MORISON proposed the health of 'Absent Friends,' having in mind particularly that veteran radiologist, Mr C Thurstan Holland of Liverpool, who had written, 'Doctor's orders must sometimes be obeyed, especially when one is not well enough to disobey them.'

Reports of Societies

HYPERTHYROIDISM AND THE THYROTROPIC HORMONE OF THE PITUITARY

At a meeting of the Section of Therapeutics and Pharmacology of the Royal Society of Medicine on June 8, Dr DOROTHY HARE presiding, Dr ARNOLD LOESER of the Pharmacological Institute of the University of Freiburg addressed the meeting on 'Hyperthyroidism and the Thyrotropic Hormone of the Pituitary.'

In the first part of his lecture Dr Loeser discussed the influence of the thyrotropic hormone of the pituitary on the thyroid and the effects of stimulation of the thyroid on the body in general. The hormone he said, acted directly on the gland cells. It was inactive when given *per os* and was without effect upon growth or the sex glands. The hormone content of the pituitary varied considerably from species to species. The content of the anterior lobe (dry) in Junkmann Schoeller units per gramme was as follows:

Ox	250-500
Rat	4,000-8,000
Pig	300
Horse	70
Man	150-1,000 per gramme in total dried gland

The thyrotropic hormone not only brought about a structural change in the thyroid but also effected the liberation of iodine-containing substance from the organ. In normal rats administration of the thyrotropic hormone raised the basal metabolic rate by about 26 per cent. A further consequence of the action of the hormone on the thyroid was a change in the carbohydrate metabolism, indicated by a diminution in the glycogen content of the liver (appearing in guinea-pigs about four days after administration). On administration of the hormone symptoms of hyperthyroidism were produced, but the maintenance of such symptoms or their progress to a permanent pathological condition was restricted by the temporary nature of the hormonal effect. All the changes except exophthalmos tended to disappear and a normal condition to return or even a subnormal condition characteristic of hypophysectomized animals. Thus it was possible with the thyrotropic hormone to produce all the effects of hyperthyroidism, but not to maintain such effects completely, and to this fact was no doubt to be attributed disappointing clinical results.

The Anti thyrotropic Substance -

In addition to these regulatory processes a second factor might be present in which the pituitary played no part—namely, an anti thyrotropic extract. Associated with the administration of the thyrotropic hormone a substance gradually appeared in the blood which worked against the hormone. The origin of this substance in the body was as yet unknown. It might be fairly definitely stated, as a result of various investigations, that it was not produced in the pituitary, thyroid, adrenals, or ovaries, therefore in the interests of clarity he preferred to use the indifferent term anti thyrotropic principle or protective factor. He restricted the term hormone to a substance secreted by an endocrine gland and having as its main function to influence the activity of other organs.

His conclusions with regard to the anti thyrotropic principle were first that the action of the inhibitory factor was not restricted to a type of specific immunity reaction. Secondly it was known that the inhibitory action of normal blood might after a certain period be increased by continued administration of the thyrotropic hormone, but this increase was possible only in the presence of thyroid and could not be obtained in the thyroidectomized animal, and thirdly the anti thyrotropic principle was antagonistic only to the thyrotropic hormone.

The refractory development of the thyroid in hyperthyroidism Dr Looser's proposal was in regard to a process by means of which the organism protected the thyroid gland against a thyrotoxic hormone. This protective effect might be viewed in two ways. First, it might be on the formation of hormone in the pituitary gland secondly, by the shutting off liberation of the thyroid from the effects of the hormone by the appearance of the antithyrotropic substance. The first account is better supported by the facts. The effects of the thyrotoxic substance and over secretion of thyroid hormone did not act in other words, the existence of hyperthyroidism is not produced. The refractory condition of the thyroid which after a certain latent period is freed from the administration of pituitary hormone could, however, be broken through by a dramatic drop of the pituitary hormone progressively increasing again. Third, the refractory and functional state of hyperthyroidism might not only be maintained but continually developed until death occurred. One action of the thyrotoxic hormone is the production of degeneration and diffuse necrosis of the liver and kidneys, was only observed under the effect of progressively increasing hormone dosage. By continually raising the dosage the duration of the effect of the thyrotoxic hormone could be extended and the animal, in contrast to those receiving a constant dosage, could be maintained in a state of hyperthyroidism until death.

These observations led to the conclusion that by continually increasing the hormone dosage it was possible to break through all the safeguards which protected the thyroid against the thyrotoxic hormone and the effect of the organism from a flood of thyroid secretion. The refractory condition of the thyroid which on a constant dosage of pituitary hormone set in rather rapidly might be overridden by continually raising the dosage. At least two ways were conceivable for the production of a continual state of hyperthyroidism: first the continual stimulation of thyroid activity with the normal protective function of the organism still preserved and secondly, the failure of the protective function accompanied by a constant or increasing stimulation of thyroid activity. With these conceptions the condition of experimental hyperthyroidism with its related clinical counterpart Basedow's disease took on a new aspect and with it the possibility of a curative therapy, as for example the administration of a highly active antithyrotropic factor as worthy of consideration in certain cases.

Discussion

Dr C. I. COPT said that the question arose whether the thyrotropic hormone had any place in the aetiology of primary Graves's disease. Was the hormone increased in amount in the circulating blood in cases of this disease? This might be expected in view of the physiological properties of the substance. If serum from a case of Graves's disease were taken and injected into the guinea pig it was found not to stimulate the gland in the same way as the patient's gland had been stimulated but rather to produce a more resting state in the gland. So far from containing thyrotropic hormone it appeared to contain an anti-thyrotropic factor. This made it rather difficult to put forward the hormone as the immediate cause of the hyperplasia and over activity of the gland in Graves's disease. Again if this hormone were increased in the body did it appear in the urine? Methods of concentrating any hormone that might be in the urine had been used in cases of Graves's disease and in no case had there been any evidence of the presence of this hormone in the urine, rather the impression was that it was less in the urine of patients with Graves's disease than in that of normal individuals. There was an extraordinary lack of agreement as to whether or not the hormone was present in demonstrable amounts in the blood in this disease but the balance of evidence was in favour of the view that if the hormone was there it was rather less in Graves's disease. American workers had suggested that it was increased in certain cases of myxoedema. Cases

of myxoedema had not been easy to obtain untreated but in two cases of primary myxoedema there was no evidence of hormone in the serum. But they differed from the American workers in that they were experimental, the serum of the American cases were the result of complete thyroidectomy. The evidence pointed to the failure of the pituitary in Graves's disease and to a lack of thyroid stimulation but they had been quite unable to do with it. If the pituitary thyrotoxic hormone was produced in excess in Graves's disease and that it was antithyrotropic in effect.

Dr R. M. BRIDGES said that he had been particularly interested in those rather unusual patients who had exophthalmos associated with hyperthyroidism. He thought they formed a class distinct from primary Graves's disease but a point of special interest was that they fell into two groups, one consisting of patients who had the exophthalmos in which there were exophthalmos and exophthalmos developed in patients who had had a thyroidectomy done for primary hyperthyroidism. From a study of the experiments with the exophthalmos number showing a relation to the thyroid rate was greater than in one group than in the other. Following on increased basal metabolic rate and the linked up in an increasing way with other experimental showing that it was possible for the thyrotoxic hormone to produce exophthalmos in the more readily in animals in which the thyroid had been previously removed. He had not quite decided whether Dr Looser believed in the exophthalmos was a separate symptom from the hyperthyroidism and was due to the thyrotoxic hormone rather than to hyperthyroidism itself.

Dr A. W. SHERMAN said that he too had been unable to find any evidence of thyrotoxic hormone in the serum of patients suffering from toxic goitre. He had had the opportunity of testing the serum of four or five patients with spontaneous myxoedema—that is not those who had developed myxoedema as a result of thyroidectomy—and in these also he had been unable to find any evidence of the thyrotoxic hormone. It appeared from the literature that these results were conflicting. In most of the cases of toxic goitre workers on this subject had found no evidence of thyrotoxic factor in the serum but there were one or two cases in which they could definitely find such evidence and there was a tendency to divide cases of Graves's disease into two groups, the larger being cases of primary hyperthyroidism without any primary pituitary involvement and the smaller group cases primarily of hypersecretion by the anterior pituitary of thyrotoxic substance and it was recommended that every case of Graves's disease should be examined from the point of view of secretion of thyrotropic hormone or the presence of such hormone in the serum. According to these workers the pituitary cases should be treated by deep x-ray therapy to the pituitary and good results were claimed in this small group of cases. The antithyrotropic factor was of considerable interest and might be used in the treatment of toxic goitre. He felt that the majority of cases of toxic goitre were due rather to an inability to form this substance than to an excessive production of thyrotropic hormone.

Dr A. S. PARKES said that the term antihormone to which Dr Looser had taken exception originated in Montreal. He was still not clear whether it was meant to imply a hormone which was anti something or something which was anti to a hormone. Most of them would agree that the antithyrotropic principle was anti to the hormone. His colleagues at Hampstead had been generally careful to refer only to the antithyrotropic serum and never to an antithyrotropic hormone. He wondered whether Dr Looser had tried out any immunological tests with the antiserum. (Dr Looser indicated that he had not.) Again in what proportion of normal sheep did he find demonstrable antithyrotropic activity in the untreated serum? (Dr Looser said that he could not answer that question.) Dr Parkes said that with their more gross tests they had not been able to discover

in a series of half a dozen normal sheep the anti thyrotropic activity which Dr Loeser had described. He wondered whether anti thyrotropic activity had any part to play in the normal animal in maintaining the endocrine balance.

DUAL PERSONALITY

SIR WALTER LANGDON BROWN delivered the annual Cavendish Lecture under the auspices of the West London Medical Chirurgical Society at Kensington Town Hall on June 3, entitling it "Dr Jekyll diagnoses Mr Hyde." Mr NEIL SINCLAIR, president of the society, was in the chair.

After some entertaining literary reflections on Robert Louis Stevenson and others the lecturer discussed the medical approach to dual personality. To the inheritors of nineteenth century materialistic medicine it was not a welcome discovery that the psychic was a causal factor in disease. The Freudian attitude to the unconscious was perhaps apt to give it too dark and depressing an impression. The lecturer started therefore from a biological standpoint, as Rivers would have done. Structurally numerous vestiges of earlier evolutionary phases were to be recognized in the human body and the human psyche from this point of view was likewise a product of evolution which showed many archaic features. Rivers did not accept Freud's conception of a censorship; he regarded the fantastic and symbolic forms in which hysteria and dreams manifested themselves as a regression to a lower level which was natural to the infantile stages of human development individual or collective. We reached the higher levels of our nervous system on the stepping stones not only of our dead selves but of our long-dead ancestors. The lecturer could not doubt that medicine would have to become increasingly psychological in its approach. The new psychology was a compromise, a selection from the doctrines of different schools but it was the needs of the present time which had led to its development. If some academic psychologists scoffed at it the simple reply could be made that it worked. Although it was only in its infancy its influence was overflowing beyond the confines of medicine into many other fields of thought just as did Darwin's exposition of the principle of evolution. A compact body of well informed medical opinion on the subject could be a much needed educative influence in a world which seemed to be steadily growing more psychologically sick.

At the present time, added Sir Walter Langdon Brown, the darker side of the collective unconscious was assuming a volcanic energy. If it was not to prevail they must live up to the Greek maxim. Know thyself, or Caliban would reconquer the island he inherited from Sycorax his mother. Dr Jekyll must diagnose Mr Hyde by recognizing his origin. Am I too optimistic in hoping that the profession to which Jekyll belonged can by psychological insight play an important part in leading the way to a calmer, humaner and more rational world?

The inquiry into the physical, psychological, and genetic aspects of mental deficiency carried on in the research department of the Royal Eastern Counties Institution at Colchester has received valuable aid from the trustees of the Rockefeller Foundation. Hitherto the research department under Dr Lionel Penrose has been financed by the Medical Research Council, the Darwin Trust and by the institution itself. Recently also a generous donation of £2,200 was made by the Hon. Alexandra Peckover towards the cost of a new laboratory and research offices provided by the institution. Now the trustees of the Rockefeller Foundation have opened the way to further developments by making a grant at the rate of £600 per annum for five years to provide additional research workers and a non-recurrent grant of £700 towards the cost of laboratory equipment.

Local News

SCOTLAND

St Andrews University

At a meeting of the University Court of St Andrews University, Principal Sir James C. Irvine presiding, Dr H. E. Hutchison, lecturer in clinical pathology in the University, was appointed to be warden of the William Low Residence for medical students in Dundee. This residence will be opened for medical students attending clinical courses from the beginning of October next. The Court has agreed to recognize Mayfield Hospital, Dundee, as a general hospital in which clinical courses qualifying for the degree of M.B. Ch.B. may be attended by medical students of the University. The new ordinance for the establishment of degrees of Bachelor of Dental Surgery and Master of Dental Surgery will come into effect from the beginning of the academic year 1937-8. The course for the B.D.S. will be five years of which four will embrace studies similar to those for the L.D.S. of the University, but the examinations will be of a higher standard and there will be an extra examination at the end of the fifth year. Those who have taken the B.D.S. may proceed to the M.D.S. after one year in practice as a dental surgeon, or after holding a post in a dental hospital and submitting to a clinical examination and presenting a thesis.

Edinburgh Hospital for Sick Children

The work of the Edinburgh Hospital for Sick Children is steadily increasing. 100 more cases having been treated in the wards in 1936 than in 1935, while the out-patient work has also increased. This has necessitated further nursing staff and to accommodate the extra nurses a house in the neighbourhood has been purchased. The home presented by Lord Forteviot last year has enabled 100 infants to be transferred from the hospital to the home, and this has greatly facilitated the work of the hospital. The report for 1936, which was presented at the annual meeting of contributors on June 10, shows that the number of cases treated during the year was 3,267, of which 1,308 were medical, 1,250 surgical, and 682 ear and throat cases. The average daily number of patients was 132, and the average duration of residence 15.5 days. At the out-patient department there were over 29,000 attendances, and in the sunlight department 5,616 treatments were given compared with 4,861 in the preceding year. The ordinary income for the year was £16,304, compared with £14,847 in 1935, while the ordinary expenditure was £20,699. The deficit was less than in the previous year, amounting to £4,395, as compared with £4,590. There was also a deficit of ordinary income amounting to £318 on the Muirfield Convalescent Home, and a surplus of £144 on the Forteviot Convalescent Home.

Astley Ainslie Institution

The report of the Astley Ainslie Institution for the year 1936 by Lieut.-Colonel John Cunningham, medical superintendent of the institution, shows that the number of beds is now 169. The Departmental Committee on Scottish Health Services gave a summary in its report of the methods and policy adopted at this institution as illustrating the lines along which modern ideas of convalescence are developing. This institution, being fully endowed, does not appeal to the public for support, and it only admits patients from the Royal Infirmary of Edinburgh requiring a prolonged convalescence. The total number of patients treated during the year was 1,077 including 221 children. The majority of the patients 749, were either cured or improved; only twenty were dis-

charged without any change in their condition, while 120 were sent back to the Royal Infirmary for further treatment. The maintenance cost per bed for the year was £151. The institution possesses a fully equipped department for physical therapy by massage, artificial sunlight, and various forms of electrical treatment. A special feature of the institution is the department for occupational therapy, which was opened in May, 1936, and which is one of the first of this kind in the country to be designed in connexion with a general hospital. This building is single storied and consists of a central section with two large wings containing the main workshops, one being allotted to "quiet" crafts such as weaving, painting, basketry, etc., and the other to "noisy" crafts such as carpentry and metal work. Large windows form the greater part of the wall area of the main workshops to provide adequate lighting and to enable the patients to work under what amounts to open-air conditions. The workshops are fully equipped with the apparatus necessary for various crafts, such as saws and lathes specially designed to assist in the treatment of patients showing orthopaedic disabilities. Great success has attended this form of therapy and its extension to patients confined to bed in the wards. For male patients confined to bed, rug making, basketry painting, wood carving, leather work and weaving with small looms have all been found suitable, while needlework in its various forms and knitting are most popular in the women's pavilions. Occupational classes for both men and women are conducted in the workshops, the men attending for two hours in the morning and women for two hours in the afternoon. The number of patients who underwent this form of training and treatment during the year was 658.

ENGLAND AND WALES

The Harveian Society

The Buckston Browne dinner of the Harveian Society of London was held this year in the Connaught Rooms, Great Queen Street, on June 10 with the president, Dr A H Douthwaite in the chair. The principal toast, that of the Harveian Society, was proposed by the Lord Chief Justice of England Lord Hewart, who told a number of stories, and after some banter at the expense of the medical profession paid its members a compliment by saying "When you meet the Recording Angel you will have a pretty easy time." Dr Douthwaite in his reply, thanked Lord Hewart for honouring the Society by attending its banquet and recalled that it was he who publicly pointed out that if the Osteopaths Bill became law osteopaths would have the right to sign death certificates. Briefly reviewing the events of the past year Dr Douthwaite said that the Society had now almost succeeded in paying its quota towards the restoration of Harvey's tower at Hempstead, it had moved into new quarters in Portland Place and Dr G de Bec Turtle had presented a snuff box on giving up the treasurership after ten years of enthusiastic work. Though this was against orders the president ended with an acknowledgement to Sir Buckston Browne for his generosity in providing the banquet. The health of the visitors was proposed by Mr M F Nicholls who congratulated Mr H L Eason Vice-Chancellor of the University of London, on his appointment as Principal of the University and welcomed Sir John Herbert Parsons president of the Royal Society of Medicine Sir William Willcox president of the Medical Society of London and Mr D C Norris president of the Hunterian Society. The toast was acknowledged by Mr Eason Mr Ernest Bevin and Mr Derek Curtis-Bennett. Mr Bevin expressed his pleasure at dining in good trade union company "with representatives of the Law the Church and Medicine. He spoke in warm terms of recent discussions between the Trades Union

Congress and the British Medical Association, and the good that must follow this contact in promoting the medical treatment of workpeople on sound lines. Co-operation was needed between the medical profession and industry, so that the problems that arose from the conditions of modern life might be tackled at an early stage. To-day there was a great opportunity for breaking down barriers, hitherto there had been too long a lag in the application to practice of the fruits of discovery, more collaboration would secure better results from the medical services. A bad defect in the national health insurance scheme was its failure to include women and children.

Manson and Ross Commemoration

The Board of Management of the London School of Hygiene and Tropical Medicine and the Standing Committee of the Ross Institute of Tropical Hygiene held a reception at the School on June 9 to meet the Earl of Athlone, K G, Chancellor of the University of London. The guests, many of whom were medical visitors from over-seas, were received in the library by Lord Athlone and Professor W W Jameson, Dean of the School. In the museum on the second floor Professor R. T. Leiper and Dr B G Peters exhibited living fresh-water snails, water fleas, and other crustacea, and fishes concerned in the transmission of disease in the Tropics, examples of diseased conditions caused by helminth parasites, and microscopical preparations of stages in the life histories of parasites causing tropical diseases. Professor P A. Buxton and Mr Leeson also exhibited live insects of medical interest. In the museum on the third floor a collection of original notebooks and other material relating to Sir Patrick Manson and Sir Ronald Ross were displayed. Dr G P Crowden demonstrated an air conditioned cubicle for use in the Tropics, and other demonstrations concerned with warmth and comfort measurements and standards for factories and shops, and the use of reinforced aluminium foil for insulation against radiant heat were given by Dr T Bedford, Dr Crowden, and Mr Luxton. In the lighting laboratory Mr T C Angus showed methods of lighting and ventilation in factories, and a method of controlling dust hazards in industry.

New Essex Hospital for Nervous and Mental Diseases

The Minister of Health (Sir Kingsley Wood) on June 14 opened the Runwell Hospital near Wickford in Essex to serve as a joint hospital for nervous and mental cases for the county boroughs of Southend on Sea and East Ham. The new hospital is on a pleasant country site of 500 acres, about twenty-four miles from East Ham and twelve from Southend, and in its arrangement advantage has been fully taken of new ideas and experience in mental hospital planning and construction. It is intended to house just over 1,000 patients, and it comprises from twenty-five to thirty separate units. In the central administration unit, in addition to the usual offices, there are a recreation hall with a fully equipped stage and modern cinema projector, a gymnasium, a lecture theatre, a library for patients and staff, as well as kitchens and bakery. At the side of this are separate occupational therapy workshops for male and female patients. Provision has been made for teaching numerous handicrafts such as rug-making, basketry, weaving, beadwork, pottery, and embroidery, and in addition there are special shops for upholstery, printing tailoring, boot repairing metal work, and carpentry. The admission hospital is a pleasant single storied building on the outskirts of the colony built so as to be light sunny, and airy, with plenty of veranda and solarium accommodation. In the centre portion of this building are housed the x-ray and light departments the pathological and biochemical research laboratories the laboratories of experimental psychology and clinical pathology, and a modern hydrotherapeutic department. A large common room for both sexes is also provided here, with facilities

for recreation and occupational therapy. The admission hospital includes clinical examination rooms where newly admitted patients are first seen by the resident physicians and male and female wards in the east and west wings. Two other separate buildings have been provided for voluntary patients one for men and one for women suffering from the milder forms of nervous disorder. These are really detached single storied villas with a large number of private bedrooms most of them opening directly on to a terrace as well as homelike sitting rooms with french windows. Another single storied building consisting of a central block and two wings serves as a sick hospital for patients suffering from physical complaints. Units for quiet and employable patients are arranged on either side of the administration building and surrounding these are large gardens with room for exercise and recreation. There are three private units for patients who do not require much supervision and are able to enjoy a considerable freedom within and without the grounds of the hospital and in a detached position, well away from the main blocks is Boundary House accommodating sixty male and 100 female patients suffering from the more severe forms of mental disorder with clinical rooms and a hydrotherapy department. The old idea of a refractory block has been dispelled in this pleasant building.

Correspondence

Moynihan Memorial

SIR,—The Board of the General Infirmary at Leeds realize that the greatest memorial to the genius and work of the late Lord Moynihan must always be advancement in the art of surgery which he did so much to promote. They feel, however, that it is their duty and privilege to perpetuate a record of Lord Moynihan's work for surgery and his labours in and for the General Infirmary at Leeds by the erection within its walls of a suitable memorial. Already a ward has been named the Moynihan Ward but much more than this is clearly required.

The Board have appointed a committee to submit and carry out a suitable scheme and on behalf of this committee I am able to state that the sum of £750 has already been received. More than this is needed if the memorial is to be adequate and I am authorized to invite subscriptions from medical and lay sympathizers. It is suggested that one guinea would be a suitable amount though more or less would be very acceptable. Subscriptions should be forwarded to the General Infirmary at Leeds in the name of the Moynihan Memorial Fund or to myself. They will all be very gratefully acknowledged—I am, etc.

CARLTON OLDFIELD

Leeds June 14 Chairman Moynihan Memorial Committee

Infectious Mononucleosis and Monocytic Leukaemia

SIR—May I refer to a point in Dr M. C. G. Israël's article on infectious mononucleosis and monocytic leukaemia (*Journal* March 20 p. 601). He states that "haemorrhage of any sort is rare in infectious mononucleosis". In general this is correct but epistaxis is not uncommon among children, and in extensive outbreaks at schools there are usually one or two severe cases. I have known it to be sufficiently serious to warrant blood transfusion. Haematuria is a traditional feature which was mentioned by Heubner in the discussion on

Pfeiffers original communication. It is certainly rare but I have seen several cases in which it was the first recognized manifestation and it may occur with a definite lymphocytosis but no glandular enlargement.

Dr Israël's second case was admitted to hospital for haemorrhage from the rectum. I saw a similar case in 1921 shortly after the recognition of mononucleosis in glandular fever. I have never seen another and so far as I am aware there is no other case in the literature.

May I perhaps mention that Türk spelt his name with out a c. He was a man of great personality and objected to the misspelling especially as German authors nearly always made this mistake.

There has been a fair amount of glandular fever among adults this year—I am, etc.

H. LETHBRIDGE TIDY

Milk-borne Scarlet Fever in Doncaster

SIR—May I who was responsible for the preventive measures at the farm add to Dr R. Watson's account of the Doncaster outbreak of scarlet fever published in the *Journal* of June 12 (p. 1189).

In the first place it should be made clear that the whole occurrence was accidental and caused by a missed case of scarlet fever. On December 14 two days after discovering the milker's sore throat I found his daughter suffering from suppurative otitis media, the parents being unaware of the nature of the ailment on account of the absence of rash. The thick purulent discharge had been treated by the father since December 2. The mammary ducts of the cow's udder must have been infected by the hands of the milker, and his hands were infected from his daughter's ear discharge or from his own throat. If his hands were so infective as to cause a mastitis in the cow I cannot understand why the infection was unlikely to reach the milk from the same source before December 12.

Mr Canning assistant county veterinary officer West Riding who took the group samples on December 15 reported no evidence of mastitis. On December 20 he was able to identify the infected cow from a group so evident were the signs of mastitis and I was able to isolate the cow. Although it is obvious that the cow must have been infecting the milk supply between December 12 and 15 I cannot believe that the udder was infectious as early as December 6 or 7. If so much progress was made by the local lesion between December 15 and 20 why was so little made between December 6 and 15?

The evidence seems to favour very strongly the view that the milk was contaminated by the milker in the earlier stages of the outbreak and that the infection was continued later by the cow—I am, etc.

A. PENMAN,

M.O.H. Doncaster Rural District

June 12

Blood Transfusion in Obstetrics

SIR—With reference to the letter in the *Journal* of June 5 (p. 1176) by Dr E. K. Mackenzie replying to Dr Owen Jones's letter (May 22 p. 1090), I would heartily endorse Dr Owen Jones's method of dealing with the third stage of labour. That method of leaving the uterus unattended during the third stage has been strictly adhered to for the past four years in this institution and the cases of post-partum haemorrhage are less than 1 per cent. The results obtained have justified its continuance as during the last four years over 5,000 cases of confinement have been attended. There are two ideas underlying this technique.

1 The uterus, being exhausted during the first two stages, requires a period of rest before the expulsion of the placenta, to stimulate the uterus at this time is like the proverbial last straw, causing the uterine muscle to relax whenever the grasp is released

2 There is the temptation every now and again while the fundus is being held by the attendant to attempt to expel the placenta prematurely, resulting often in the discharge of blood clot, and when the uterus, after being pressed in this manner, assumes its normal position it sucks up from the vagina septic material into a potentially sterile cavity

I am rather surprised at Dr Mackenzie's large percentage of cases of post-partum haemorrhage and the immediate results obtained by the use of femergin and coramine. Such simple medication has not been sufficient in most of our cases to "quickly put the patient right," as more often we have to resort to intravenous gum saline or to blood transfusion. Furthermore, it is my opinion that those methods of dilatation of the vulval outlet and of the cervix shortly before completion of the first stage cannot be too strongly condemned. In this institution vaginal examinations are never permitted after labour has begun unless there are obvious complications.

As regards the anaesthetic, I find that nitrous oxide gas or even ethyl chloride are preferable to the administration of chloroform, and the apparatus supplied by the British Oxygen Company for the administration of nitrous oxide would be of great use to the general practitioner for any obstetrical complication that he has to deal with in the course of his practice.

It would also appear that the manual removal of the placenta twenty-seven times in a series of 1,279 cases seems to be a large percentage in the work of a general practitioner. I am of opinion that in obstetric practice it is best to leave things to nature when the patient's condition, temperature, and pulse remain normal. A patient should be examined abdominally, and the obstetrician should obtain sufficient knowledge as regards disproportion, delay in labour, or of the satisfactory progress thereof. I agree that ante natal examination is of first importance, but this is not always possible in hospital or general practice—I am, etc.,

County Maternity Hospital
Bellshill June 8

H J THOMSON

Treatment of Hernia

SIR—In associating myself with the remarks of Mr Delisle Gray in your issue of June 12—in which he suggests that opposition to the injection treatment is due to a complete misconception of its aims, effects and results—I would like to make a further comment on your leading article of June 5.

The term "sclerosing" which can properly be applied to the old phenol injections, which relied for their effect on destruction of tissue resulting in scar formation, is not applicable to most of the fluids in present use, and certainly not to that of the late Dr Enrique Pina, whose fluid I am using. This is "proliferating," in that it causes an exudate which becomes progressively granulation and fibrous tissue and is not formed by destruction, or necrosis of adjacent structures but results in a net gain, of new tissue, to the area. This is well demonstrated in recurrent hernia, where the injections fill up cavities and repair deficiencies in the body wall. It has also been demonstrated by microscopical examination of injected tissues—I am, etc.,

London W 1 June 12

E. W. ARCHER.

Carcinoma of the Oesophagus

SIR,—I should like to endorse Mr Tilley's opinion as expressed in his article on carcinoma of the oesophagus treated by x-ray therapy. With the modern method of treatment there does seem a little more hope than formerly. In a small series of cases treated at University College Hospital of carcinoma of the "middle third" of the oesophagus, proved by oesophagoscopy and biopsy, the longest survival is over three years (May, 1934). This patient was sent to me by Miss D J Collier. Treatment was followed by an increase in weight of 4 st. The patient can now eat anything she wishes, leads a normal life, and radiologically shows so far no signs of recurrence—I am, etc.,

E L G HILTON,

Hospital.

Streptocide for Streptococcal Empyema

SIR—The report of Dr James L. Brown in the *Journal* of June 5 (p 1157) regarding the treatment of streptococcal empyema with prontosil prompts me to give my experience with a similar drug in similar cases.

A man aged 26 years was admitted to the Thornton Isolation Hospital on March 26, 1937 with influenzal pneumonia of ten days duration. On admission he was extremely ill with severe dyspnoea and cyanosis, his temperature was 103° pulse rate 130 and respiratory rate 56. There were obvious signs of fluid in the right pleural cavity and on aspiration 18 oz. of thin purulent fluid were withdrawn. Culture of the fluid gave a pure growth of haemolytic streptococci. Streptocide, 1/2 gramme was given four hourly by mouth. Aspiration was repeated on March 28 and again on April 2, and 2 oz. of thin pus were withdrawn on each occasion. Clinically he continued to improve and on April 10 no fluid could be obtained by aspiration. There were now only signs of thickening of the pleura. His general condition gradually improved, and by April 20 his temperature, pulse and respirations were normal. A final paracentesis was done on May 1 with a negative result. He was discharged in a fit condition on May 17. This patient had oral medication only, and no operative procedure beyond aspiration of the chest. Hydrochloric acid dil 10 minims three times a day was given with the streptocide.

A comparable case treated in January was given proseptasine 1/4 gramme three times a day, with no hydrochloric acid dil and though his temperature, pulse, and respiration returned to normal rib resection had to be carried out to evacuate thick pus from the pleural cavity.

It would appear that large doses of the sulphonamide drugs by mouth may achieve the result obtained by Dr Brown with intrapleural therapy. In order to assess accurately the value of the sulphonamide drugs in streptococcal empyema in adults it would be necessary to know what percentage, if any, of those cases cleared up with repeated aspiration and without recourse to rib resection before prontosil was used for streptococcal infections—I am, etc.,

Fife June 7

JAMES B FLEMING M B, Ch B

Enuresis in Children

SIR—Dr McGregor's contribution on enuresis (*Journal* May 22, p 1061) is very valuable, and any correspondence which suggests help in this sometimes almost incurable condition may be useful. I therefore venture to suggest the influence that quite ordinary articles of diet may have, as I have not hitherto seen this mentioned.

For example a mother consulted me on troublesome enuresis in a 3 year-old child who was otherwise normal. The child was being given "groats" as a tea-supper dish and omission of this instantly cured the trouble. Similarly,

barley and barley water preparations may be responsible for puppy like frequency of puddles by day or night according to the time of administration

Another particularly interesting case occurred in a girl aged 7. In this case "psychology" might have been blamed (she had lost her mother) or slight babyhood habits of masturbation. All the treatment prescribed by her own father—an experienced general practitioner and a patient and affectionate observer of his own children—and various eminent children's specialists was of no avail but she was cured by the simple observation of the housekeeper that the child was always worse if she went out to tea or was given cow's milk for supper at home. Elimination of cow's milk from the diet cured the enuresis completely and immediately. At about 9 years of age the child was sent to boarding school with instructions that milk was not to be given after midday. All went well but in a later term there was complaint of enuresis and it was found that cow's milk had been given at tea time. Correction of this mistake again immediately effected a cure.

The fact that for some years this child drank goats instead of cow's milk (which was 'tuberculin' suspect in the district) may have contributed to this sensitivity to cow's milk, but these two instances suggest that the ordinary routine of habits and diet may be usefully investigated in cases of enuresis.—I am, etc.,

London W1 June 7

D C LOGAN

Health and Milk Supply of Malta

SIR—While I fully agree with the statement of Dr Harbour Stephens (June 5, p. 1179) that the infant mortality in Malta is high enough to call for action, I cannot substantiate fully his views on the cause or causes of this extraordinarily high death rate, which has been persistently over 250 per 1,000 for years. The following are the facts:

- 1 Early marriages are the rule
- 2 Large families and frequent pregnancies are also the rule especially in the depressed classes
- 3 The milk in Malta is largely obtained from goats because there is not sufficient pasture for the cow
- 4 The dry season lasts generally throughout the best part of six months—April to September. During this period the temperature rises rapidly to 80 to 85° F but winds prevail except during the month of July
- 5 Condensed milk, often sweetened and of inferior quality is very often looked upon with favour by the lowest classes who may substitute it entirely for fresh milk
- 6 This habit has established itself largely because of the ban on fresh milk from all sources imposed by the naval and military authorities for use by soldiers and sailors ever since the discovery of *Brucella melitensis* and the report of the Royal Commission that followed
- 7 Undulant fever is rampant among the civil population (up to 5 per 1,000 of the population get this fever in the course of the year). But cases of infection are practically unknown under 5 years of age. Concurrently with the human infection a similar infection occurs in goats (up to 15 per 1,000 in some herds) though the goat is often apparently sound and its yield of milk unaffected
- 8 The chief period of infant mortality coincides with the dry, hot, and windy season of the year but the dominant affections are gastro-intestinal not respiratory or circulatory. The same period coincides with the appearance of the house-fly in vast numbers
- 9 In spite of repeated periodical warnings issued by the public health department to boil all fresh milk before use the incidence of undulant fever among the adult population and of intestinal infections with a high mortality in infants has not been appreciably reduced
- 10 Goats are seldom fed on imported foodstuffs and fresh green vegetables in considerable variety are available for animals and human beings in sufficient quantities throughout the year with the exception that grazing is absent almost everywhere during the long dry season.

11 The methods of efficiently combating the growing social danger of undulant fever have preoccupied the Government of Malta for years, but apathy and prejudice even to passive resistance on the part of a considerable section of the community and the vested interests of the goat owner and milk vendor have proved insurmountable until the last few months

12 Effective steps have at last been taken after a strenuous campaign for clean and safe milk largely conducted by a few medical men in the lay press. It was pointed out that fresh milk has a food value infinitely superior to the tinned article and that all that was required was to make it safe for all without enhancing its cost price. This could only be undertaken by the Government. Accordingly, pasteurization on a large scale by the holder method has been decided upon while special researches are being undertaken with a view to discovering efficient goat vaccine against brucella infection. All the goats will gradually be rounded up and their free circulation in the public thoroughfares will no longer be possible. This experiment in social and communal hygiene which will cost the Government an initial outlay of nearly £50,000 will be watched with the keenest interest not only in Malta but throughout the Empire.—I am, etc.

Fowey June 6

Air Raid Precautions

SIR—We should object to the popularization of air drill not because as Dr Macdonald Ladell says, it accustoms the public mind to the idea that war is inevitable but because it accustoms the public mind to the idea that the dangers can be materially lessened by gas masks and such devices. I agree with both Drs Ladell and Leys that all attempted precautions against bombing are futile but, unlike these gentlemen, I believe that, in view of the armaments race now in progress, war is indeed inevitable and that therefore it behoves the public to begin to do something about it.

Dr Ladell quotes Coué, and there is an idea among some pacifists that Couéism will see us through, that all we have to do is to "think" there will be no war—and there will not be. The public, however, will be ere long called on to think more constructively than this. And first let them cease from blaming their governments. The governments are doing their very best to stop war, and obviously they cannot manage it. War is coming.

Is it not a strange thing that neither the medical profession as a whole, nor yet the official heads of the profession, have the slightest contribution to offer? They merely put themselves humbly under the direction of a government department. And yet elementary common sense indicates that the supreme problem in air raids on cities will not be one of fighting fires, of neutralizing gases, or of "rushing" the injured to hospitals. It will be a psychological problem. There will be universal panic in cities, and the inhabitants who are not killed outright will stampede towards the country. Nothing will stop them. Appeals to a drowning man to cease breathing for patriotic reasons, or for the sake of the women and children, leave him cold. There are such things as elementary instincts, and in such a case as this that of self preservation will come first. Has the medical profession, then, nothing to say about this, which will be a supremely psychological problem? Have the Freudians the Adlerians the Jungians, the psychiatrists, the neurologists *et hoc genus omne* nothing more to advise than that if the worst comes to the worst we must keep cool and be guided by the police?

Let me end with one suggestion a personal one. World war is the inevitable nemesis of world-wide mechanization of the individual—that is of world-wide bureaucratization. This last is also inevitable in the life of big cities.

Hence the destruction of civilization (of which war is but the final stage) can only be stopped by stopping the conditions which give rise to bureaucratization and the destruction of individuality. In other words, we must reverse the modern drift from country to town. *Obsta principis*. If this be a true reading, then why should we wait? Why should not the medical faculty, which professes to know something about psychology, take a lead, instead of sitting dumb like the rest? A drastic cure, it will be objected. Yes, but world war is going to be unutterably more drastic. Do not let us dope ourselves any longer. Let the trek to the land be initiated now, and by the medical profession—I am, etc.,

North Queensferry, Fife, June 6

A J BROCK

SIR,—It is strange to find that some medical men who are keen on the prevention of disease do not seem keen on the prevention of casualties due to air raids. Not for one moment is it maintained that even if intensive training in air raid precautions were adopted there would be no casualties, but it is certain that they could be greatly minimized both as regards mortality and disablement. There is no doubt that the casualties due to high explosive would be heavy, but we could save many by education in the principles of air raid precaution. As to the 'gas' casualties, they might be almost negligible if doctors and the general public knew what steps to take to prevent their becoming casualties, and, incidentally, if an enemy knew that a nation was trained in precautions the use of gas would be less likely.

Three types of respirator have been *proved* to be 100 per cent effective in protecting the eyes and lungs against any type of gas known or likely to be used in warfare, and the number and character of gases suitable for this purpose are limited for various reasons. The effects of vesicant gases on the body could be largely prevented by efficient attention at first aid and decontamination stations if this treatment were given early. That training in air raid precaution is war mongering seems a peculiar attitude to take, if it is necessary to have an army, navy, and air force, surely it is equally necessary to take any possible steps to protect the general public, as in any future war the public would be attacked. Some medical men do not appear to realize that the method of dealing with gas casualties especially those due to liquid mustard gas, requires special study.

The attitude of one of your correspondents Dr R M Ladell (June 5, p 1179), who states that he refuses to take part in air raid precautions is surely not the correct one for members of our profession. In a railway accident he would not refuse to attend to an injured locomotive driver even if he were the cause of the accident and equally in an air raid, even if he considered that his own country were to blame for the war, he would willingly attend to any casualties but does he realize that if he does not study the subject of air raid precautions he would speedily become a casualty himself if the raid were accompanied by mustard gas and thus throw an additional burden on the already overburdened first aid services?

It is manifestly our duty as citizens to do all in our power to prevent war but considering that all other important countries are taking precautions and therefore believe that they are of some use, we should surely do our best to at least diminish the effects of an air raid in the event of our being involved in such a ghastly

Gas Lectures, Economics, and War

SIR,—Dr Leys and Dr Ladell have hinted at a truth about war which does not seem to be generally recognized—namely, that the populace is not naturally warlike, and can only be made so by strenuous efforts on the part of statesmen and those professional speakers whom they can enlist, such as gas lecturers and frank adventurers of the Bottomley type. This was brought home to me during the late war when fiery sermons at home contrasted oddly with the spirit of junior officers and men in the trenches who were just 'fed up' and wanted to go home, there were no ideals left by 1916, and it is sheer humbug to pretend that the average man cared a damn what the peace terms were so long as he got peace.

International hatred is an artificial product which can only be kept alive by propaganda—that is, by suppressing the truth. International hatred has to be carefully tended or it dies out, there were serious signs of this happening on the Western Front at Christmas 1914, and the higher command on both sides had to assert themselves in order to prevent the war petering out from the fraternization of Tommy and Fritz.

War fever is used by statesmen as a substitution symptom for the social unrest and revolutionary tendencies due to the pangs of poverty and malnutrition and those States in which these diseases are worst tend to be the most warlike. That is why in England, where we have only a million and a half unemployed and where only a third of the population is starving we are not so aggressive as other countries, in which even the middle classes have to go without butter. In every modern State there is a danger of revolution, owing to the dissatisfaction of a big fraction of the population with their economic lot. In England it is much less than in most other countries, because the economic conditions are much less bad.

Poverty and uncongenial working conditions are the cause of social unrest, and so indirectly of war, for war is the only certain remedy for poverty. That is because poverty in the modern world is due to lack of money, and not to lack of goods. If there are too many goods for the money available the goods are destroyed and their production is restricted but war cures this by the simple process of borrowing money and paying it as wages to the unemployed for making guns and poison gas. These men are then able to buy the potatoes which would otherwise have been fed to the pigs, and the fruit which would have been allowed to rot under the trees as it did last year, and the farmer makes a profit instead of a loss in fact the whole community becomes more prosperous.

War preparations are already bringing about this happy state of affairs unemployment is declining and there is far less destruction of food than there was a few years ago. So gas lectures, by persuading people that war preparations are necessary are actually helping Europe to achieve a higher standard of living than would otherwise be possible, and are thereby staving off revolution.

I do not want it to be thought that I am advocating war but under the present financial system it seems inevitable. If rearmament were to cease now there would almost certainly be a slump employment would diminish and with it purchasing power and large numbers of people would be unable to obtain the food which actually exists. This food would then be called a 'glut' and a burdensome surplus and the efforts of statesmen would be directed towards its elimination.

Whether the peoples of the civilized world would stand this again as they did in 1931 is to be doubted if they revolted we might be involved in a situation as bad as war I cannot imagine anything worse In my view Sound Finance is rushing us full steam ahead to disaster, and I would remind anyone who says Come, come it's not so bad as that of the nigger who fell off a sky scraper and was heard to remark as he hurtled past the twelfth story 'I'm all right so far'—I am etc

Norwich, June 6

FREWEN MOOR

"What is Osteopathy?"

SIR—May I be allowed to answer the letters of Sir Morton Smart and Sir Ernest Graham Little in your issue of May 29, first in a personal capacity and secondly in my capacity of president of the British Osteopathic Association?

I personally readily admit that Sir Morton Smart and I do not agree as to the interpretation of osteopathic findings I did not and do not mean to convey any other impression The quotation from his book was taken to substantiate my argument with Sir Walter Langdon Brown that fundamentalism and modernism are not incompatible noting that the book in question was published in 1933 But the physiological circulatory conditions prevailing around a joint and the pathological findings supervening in joint injury are facts which are not altered by what interpretation he (Sir Morton Smart) puts on them or by what I read into them As president of the British Osteopathic Association I wish to emphasize that there is no evidence whatsoever that the promoters of the Regulation and Registration of Osteopaths Bill accepted the British School of Osteopathy as satisfactory Osteopathy in America is not as Sir Ernest Graham Little states a declining cult Figures are available to all It is true that there are twice as many chiropractors as osteopaths in America That is due to the fact that the osteopathic course is four years and the chiropractic course is two years It is unmanly of Sir Ernest to taunt the osteopaths with this invidious comparison, which is brought about by the adoption of the course which he recommends—namely the conforming to something very nearly approaching the normal [medical] curriculum in this country

Why does not Sir Ernest Graham Little visit the American Osteopathic Colleges as he is so very interested in the subject? He might come back with views similar to those of Sir Robert Stanton Woods who in his presidential address to the Physical Medicine Section of the Royal Society of Medicine said

Underlying the principles of osteopathy at any rate as the subject is authoritatively taught there is much that is fundamental in medicine Of the remainder there is undoubtedly matter which is new to us or at any rate to me but which we are not in a position to reject with reasoned argument Some of the teaching we cannot accept and part at least of this is already being modified But that much of osteopathic technique will be and indeed is being adopted by our profession is undoubted while some of the principles which I have in very inadequate fashion attempted to outline cannot be rejected without a more reasoned consideration and further clinical and experimental investigation than they have hitherto been accorded

Sir Ernest Graham Little asks for certain information regarding the educational aspects of osteopathy in this country These details will be made available to the public in due course, when the time is ripe—I am etc

Edinburgh June 9

W KELMAN MACDONALD

The Age Incidence and Sex Incidence of Milk-borne Typhoid

SIR—The late Dr Vernon Shaw's report (1937) on the Bournemouth epidemic contains some useful data in relation to the age and sex distribution of typhoid conveyed by milk which have not received notice in the reviews I have seen A high incidence among women and children has come to be accepted as a feature of milk-borne typhoid In a brief reference to the matter, and on rather slender evidence I ventured the view last year that while there was some ground for this belief the case was not very convincing Almost at the same time Hill and Mitra (1936) made an exhaustive comparison of outbreaks caused by infected water with others due to milk and concluded that on the average women were more heavily affected, and there was a slightly higher proportion of children (especially males) in milk epidemics but that in any particular instance the age and sex distribution would be very far from convincing evidence of the medium of infection Godfrey, in the State of New York, had come to somewhat similar conclusions

The Bournemouth epidemic was relatively large and the figures are, therefore by themselves of some value The age and sex distribution of 284 cases in Bournemouth, 205 in Poole and 26 in Christchurch (a total of 515) are given in Appendix 3 of Dr Shaw's report From charts in the body of the report it is evident that all these cases (with the possible exception of one in Christchurch) were primary house infections and therefore presumably due to milk This freedom from secondary cases is astonishing but there is nothing in another recent account by Dr H. Gordon Smith, medical officer of health for Bournemouth, to cast any doubt upon it From Shaw's figures the following table has been put together

Typhoid in Bournemouth Poole and Christchurch

Age	Males	Per cent	Females	Per cent	Persons	Per cent
—5	36	17.65	33	10.61	69	13.40
—10	42	20.59	46	14.79	88	17.09
—15	36	17.65	41	13.18	77	14.95
—20	23	11.27	43	13.83	66	12.81
—30	34	16.67	51	16.40	85	16.50
—40	13	6.37	38	12.22	51	9.90
40+	20	9.80	59	18.97	79	15.34
Total	204		311		515	

The numbers of males and females under 15 were nearly equal but the male children formed 56 per cent of all male cases while female children were only 39 per cent of female cases The percentage of 45 for children of both sexes is not very different from that recorded in some water borne epidemics Over the age of 15 there were 191 female cases as against ninety males a ratio of 212 to 100 The sex ratio over the age of 20 was even higher being 221 to 100 At first sight these are striking facts Unfortunately they cannot be placed against a population at risk in ages and sexes They may however be compared with the age distribution of Bournemouth's population in 1931 The ratio of females to males over 20 years old in the population was 163 to 100 If the consumers of the affected milk in Bournemouth, Poole, and Christchurch

were in anything like this sex proportion the selective incidence on adult females while remaining substantial, was much less impressive than would at first appear. Since a somewhat similar distribution may occur in some water-borne outbreaks (although it appears to be a much less constant feature)—and we know little about the age and sex incidence of case-to-case infections—it still seems evident that this method of differentiating the cause of epidemics is in practice unreliable and should be given less prominence than is customary in disquisitions on the subject.

About a year ago the late Dr Shaw kindly supplied me with similar data concerning the Epping outbreak of milk-borne paratyphoid in 1931. His report has never been published and I am therefore now giving the figures, which may be useful to those interested in the subject.

Paratyphoid B in Epping and Neighbourhood

Age	Males	Females	Persons
—5	25	29	54
—10	31	24	55
—15	18	14	32
—20	15	19	34
20+	27	58	85
Total	116	144	260

Here, too, it is apparent that women over 20 were twice as heavily involved as men and 64 per cent of the male cases were under 15 years of age. These ratios again, may not be peculiar to paratyphoid conveyed by milk, although the material for comparison is very scanty—I am, etc.

Cardiff June 10

RALPH M F PICKEN

Medical Aid in Southern Spain

SIR—The Southern Spanish Relief Fund, whose hospitals in Almeria suffered severely in the recent bombardment appealed through your columns for the voluntary assistance of doctors. Five applications in all were accepted after irreproachable references from colleagues had been received and after two of the applicants had been interviewed by a leading London doctor. Four of these five had successively to be repatriated in their own and our interest leaving us with liabilities of over £200.

I honour the kindly reluctance of reference writers to give information that will prevent acceptance of a colleague's application but I hope that your readers may feel the same kindly reluctance to let a compatriot suffer serious loss thereby. For I feel it impossible to charge expenses of the character incurred to a fund raised for the Spanish wounded women and children. Failing help they will have to be met from a private purse already depleted with running and raising money for these hospitals.

Any subscriptions for the relief of this personal liability should be marked "Medical" and addressed to E T Melling, I.C.I.S., hon. treasurer Southern Spanish Relief, 10 Old Jewry, L.C.2. Should they exceed the total liability subscribers will be consulted as to the refund or redispension of the balance—I am, etc.

Bicentenary of Bristol Royal Infirmary

SIR,—Sunday next, June 20 marks the completion of 200 years' work at the Bristol Royal Infirmary, for on this day in 1737 the out-patient department was opened for the reception of patients, though the formal opening did not take place until December of that year. We feel that the bicentenary of the oldest provincial teaching hospital in the kingdom is a matter of more than local interest and importance. To mark the occasion a carnival is being held at the Clifton Zoo on July 7, 8, 9, and 10. The formal celebrations will take place later in the year, probably early in October, when it is hoped that former students and others associated with the Infirmary will make a special effort to be present—I am, etc.,

E. WATSON-WILLIAMS, Ch M,
Bristol June 14 Honorary Secretary, Bicentenary Celebrations Committee

Obituary

F W COLLINSON, M.D., F.R.C.S. Ed

Consulting Medical Officer Royal Infirmary Preston

We have to announce with much regret the death of Dr F W Collinson, a greatly respected member of the medical profession in Lancashire who had been associated with the Preston Royal Infirmary for fifty years. He was president of the Lancashire and Cheshire Branch of the British Medical Association in 1929 and chairman of the Preston Division in 1922.

Frederick William Collinson was born in 1853 at Alnwick, one of three sons of the head master of the Duke of Northumberland School in that town. After leaving school he was apprenticed to a chemist and druggist at Alnwick and became a member of the Pharmaceutical Society. At the age of 27, however, he made up his mind to become a doctor and entered as a medical student at the University of Edinburgh graduating M.B. and Ch.M. with honours in 1885 and obtaining the M.R.C.S. Eng. in the same year. He proceeded to the M.D. degree and became M.R.C.P. Lond. in 1900, and took the F.R.C.S. Ed. two years later.

His first resident posts were those of house physician at the Edinburgh Royal Infirmary and resident medical officer at the Cowgate Dispensary. In 1887 he went to Preston as senior resident house surgeon at the Royal Infirmary. After two years in that appointment he set up in private practice but continued his connexion with the hospital as a member of the honorary medical staff. He brought with him from Edinburgh the Listerian outlook and technique and little by little the surgical practice of the hospital then in a very backward state, was brought into line with the new doctrines. When towards the end of the century the late Sir Charles Brown decided to give an operating theatre to the Royal Infirmary he and Dr Collinson visited many centres in order to be able to incorporate in it the latest principles of construction and equipment. Dr Collinson's skill in surgery became known far beyond Preston and he contributed a number of papers on operative procedures to the *Lancet* and the *British Medical Journal*. Besides his work at the Preston Royal Infirmary he was consulting surgeon to the Lytham Cottage Hospital and visiting medical officer to Goosnargh Hospital. During the war he did fine work for wounded soldiers at the Moor Park Hospital. In his later years he took a prominent part in the administration of the town and after service on the Town Council as made

an alderman, retiring from public life two years ago at the age of 82

Dr Collinson was held in the highest esteem by the medical profession of Preston and the surrounding country, his kindly wisdom endeared him to all his colleagues. The interment at Broughton, preceded by a service at Preston Parish Church, was attended by many representatives of medicine and of the varied public interests which he had served so faithfully.

ARTHUR DOUGLAS HEATH, M.D., F.R.C.P.

Consulting Physician General Hospital Birmingham

We much regret to record the death of Dr Douglas Heath, the well known Birmingham dermatologist. Born at Exeter sixty six years ago and educated at the Grammar School there, Heath received his medical training in London at University College Hospital. He obtained the M.B. Lond. with honours in 1894, the M.D. a year later, and the M.R.C.P. in 1901. He was elected to the Fellowship of the Royal College of Physicians a few years ago. After a full series of resident hospital posts he came to Birmingham, where for a few years he was in general practice and held the posts of surgical casualty officer and later casualty assistant physician at the General Hospital. He developed a special interest in dermatology, and in 1906 took charge of the newly created department of skin diseases. For thirty years, both in hospital and in consulting practice, he was regarded as the foremost dermatologist in Birmingham.

Heath, although of a somewhat retiring disposition, had a strong sense of duty, and he took a full share in the developments and work of his department of medicine. He was honorary secretary and later vice president of the Dermatological Section at Annual Meetings of the British Medical Association, in 1926 he became president of the British Association of Dermatologists, and in 1931 was president of the Midland Medical Society. In the latter office his wide knowledge and his enthusiasm were much appreciated.

A kind and sensitive man, Heath's rather didactic utterances and his swiftly formed opinions might have belied his true character, but, curiously enough, people even on meeting him for the first time were rarely deceived. He was an uncompromising Conservative, and his attachment to the established order of things was often evident. Until shortly before his retirement Heath travelled between his consulting rooms and the hospital on a push bicycle—which was neither washed nor oiled from the time he bought it until he exchanged it for a new one. He often pointed out that this was the most care free of all means of transit!

Heath was a man of many interests. His collections of antique furniture, of clocks, and of watches were some of the most valuable in the country, and as a judge of these things he was regarded as pre-eminent. Here as in his work his careful scrutiny, his sound judgement, and his frank and clear expression of opinion were characteristic. His association with his native county was preserved by membership of the Devon Society of which he became president. Fishing and bridge claimed much of his attention, in each he had a way of his own. In committee he was outspoken, but no one was ever hurt or offended.

A wide circle of students, patients, and friends feel that a Birmingham institution has gone, a man who was an encyclopaedic teacher, a considerate doctor and a warm hearted friend.

H. W. F.

C. H. SHORNEY WEBB, F.R.C.S.

Mr Rufus C. Thomas writes: The news of the death of Charles Shorney Webb occurring as it did just two years after his appointment as consulting surgeon to the West Middlesex Hospital must have come as a shock to all who knew him or his work. Brief though his period in West Middlesex had been, he had left his mark written indelibly on the surgical side of the hospital, the rapid development of which is known and appreciated throughout the very wide area from which its patients are drawn. To Webb's keen interest and sound surgical judgement this development is very largely due. He gave freely and of his best to the department of which his was the guiding hand and whose interests he had so closely at heart. To those of us who, like myself, had the privilege of knowing and working with him during this time his passing leaves a sense of loss which is difficult to express. His highly sensitive character was a happy blend of simplicity and deep understanding. His gentle sympathy and never failing courtesy earned for him a very deep affection, shared alike by us who worked with him and by those who, in their hour of need, came under his care. His time was short. His memory will remain, our thoughts of him filled with that feeling of kindness and friendship which to those who knew him well, was the very essence of his nature.

'E. T. C. M.' writes: The obituary notice of Charles H. Shorney Webb in your issue of June 12 is so passingly beautiful and has permanent value. 'No man liveth to himself' is indeed true of Webb. We saw his body quickly reduced to ash by the flame, but his influence in our surgery, in our art, in our grip of unseen things, will be handed on through us to the next generation and will never die. We, his friends who are still in 'the front line of battle' are compelled to pay a tribute of thanks to the outstanding contribution he made to our morale in this fight. Against what appeared to us insuperable odds he rose victoriously from defeat and despair. To those who saw this 'rebirth' there can never again be a hopeless case. Moral and spiritual war wounds in a world imprisoned in material things are either not recognized or not estimated in the cost of war. Many of us have known in ourselves and have seen in others their pain and disabilities. In these peaceful years some have, like Webb, found recovery. It is an inspiration of hope to those with scars still unhealed, with mental and spiritual faculties still distorted, to know of one who came back from 'death' to 'life'.

Dr W. Guyon Richards writes: May I pay a tribute to the memory of Dr JOHN ROUND whose death was recorded in the *Journal* of June 12. For a number of years Round spent time, energy, and money on research in regard to the early diagnosis of cancer, and in conjunction with Mr D. A. Ruddle worked out a test from urine on Benda's lines. He also suggested that zinc played an important part in cancer, and they found zinc was increased in the growth and diminished in the faeces. I shall always remember Round's zeal, kindness, and modesty. I feel it was an honour to have worked with him and assisted his work in a small way. He had the most comforting steadiness of character and bearing and was free from all self seeking.

J. G. McN. writes: I have just seen with great regret the notice of the death of Dr JOHN LUKE JACKSON in the *Journal* of May 1 and should like to pay tribute to his memory. He served with me for a short time in No. 4 Clearing Hospital during the Battle of the Aisne in September 1914. The hospital was short handed and overwhelmed with work, and Dr Jackson was one of several medical officers sent to it for temporary duty. He showed

himself to be a very good surgeon, an excellent administrator, and a pleasant, cheerful comrade. I should have liked to retain his services, but when I was asked to find medical officers to replace casualties among regimental medical officers Dr Jackson was the first to volunteer. Soon afterwards he was taken prisoner and I did not meet him again till after the war. Attending a meeting of a medical society at Knowle Mental Hospital I was delighted to find that Dr Jackson was the superintendent. Though my acquaintance with him was of short standing I had been greatly impressed by his personality and am exceedingly sorry to hear of his too early death.

A veteran member of the British Medical Association, Dr LEE FYSON COGAN, J.P., died at his home in Sheep Street, Northampton, on June 9 in his eighty-ninth year. His father was the Rev Lewis Rew Cogan, vicar of Winsley with Limpley Stoke near Bath. He studied medicine at Bristol and at Guy's Hospital, and obtained the diplomas of L.R.C.P. Ed and M.R.C.S. Eng in 1870. After serving as assistant resident medical officer at the Northampton General Infirmary Dr Cogan was appointed medical officer of health for the county borough of Northampton, a post which he held for twenty-six years. He was also medical superintendent of the Northampton Borough Hospital. He joined the British Medical Association in 1872 and continued his membership without a break for sixty-five years.

Dr HERBERT CHARLES HORACE BRACEY son of the late Dr Herbert Bracey of Bristol Road, Birmingham has died at the age of 55 in Dudley Road Hospital Birmingham after a serious operation. He had been on the staff of the Warwickshire County Council since 1912 and at the time of his death was senior assistant county medical officer of health. Before his service in Warwickshire he was on the staff of the Birmingham Education Department as assistant school medical officer and shortly after qualifying he held the posts of house physician and house-surgeon at the Queen's Hospital Birmingham. He was a Fellow of the Society of Medical Officers of Health took an active interest in the Royal Medico Psychological Society, was closely associated with Floodgate Street Medical Mission and was president of the League of Nations Union for the Acocks Green district of Birmingham. Dr Bracey was a very able clinician and a keen student of psychology, rendering him well equipped for dealing with the physical and mental health of the school child one of his principal activities. His association with the Dudley Road Hospital in the great war drew him again to that hospital during his last illness and his untimely death will be deeply felt by a wide circle of friends, personal and professional who found him always kind and sympathetic and ready to give of his best to his fellow men. His loss is particularly felt by the staff at Warwick where he was held in the highest esteem.

Medical Notes in Parliament

In the House of Lords on June 14 the Physical Training and Recreation Bill which has passed the Commons was read a first time.

The House of Commons this week considered the Education Estimates and required discussion of the Estimates for the Ministry of Health. The vote for the Board of Control was also put down for discussion. In connection with the Finance Bill on June 9 the House approved the clause increasing the Income Tax for 1937-38 from 1s. 6d. to 1s. 8d. The clause proposing a 10% increase in the rate of the Income Tax was dropped on June 10. The Finance Bill was given on June 10 to

the Civil List Act, the Diseases of Fish Act, and to other Acts.

The Parliamentary Medical Committee met at the House of Commons on June 10 and decided to ask Sir Kingsley Wood to receive a deputation on an early day about the decision in the Additional Benefits Amendment Regulations to permit under the National Health Insurance Act, sight tests by recognized opticians. The Minister has agreed to receive the deputation on June 17.

The second reading of the Children's and Young Persons (Scotland) Bill was moved in the House of Commons on June 10. This Bill had already passed the House of Lords. Mr T. M. COOPER the Lord Advocate, said this was a consolidation Bill incorporating the relevant provisions relating to persons under 18 years contained in four statutes, one in 1910, one in 1928, one in 1932, and certain provisions of the Education (Scotland) Enactment Act 1936. The measure put the law into a convenient form without introducing any change. The Bill was read a second time and sent to a committee of the whole House.

The report stage of the Factories Bill was taken in the Commons on June 15 and the following days. Sir Samuel Hoare withdrew a new clause dealing with washing facilities and a new clause proposed by Mr Barnfield for the prohibition of night baking was defeated. New clauses were added to the Bill which dealt with protection of the eyes in certain processes and with accommodation for clothing.

The Trade Marks (Amendment) Bill passed through a standing committee of the House of Commons on June 15.

Ministry of Health Estimates

The House of Commons in Committee of Supply last week considered the vote for the Ministry of Health. Sir KINGSLEY WOOD said that the net total estimate for 1937 had reached over £22,000,000 while the estimates for all services administered by the Department involved an expenditure of some £166,000,000. The Ministry of Health estimates this year showed a net increase of nearly £500,000 over those of last year. Progress under the slum clearance campaign was reflected in the provision of an additional £500,000 in respect of new houses and for the first time there was £207,000 for grants under the new Midwives Act. There had been an increase of £7,000,000 in the total of loans sanctioned to local authorities which amounted to more than £42,000,000. Considerable activity had been displayed in the provision and extension of sewers and sewage disposal and there had been increased provision for public recreation. In 1926 the total loans for public recreation amounted to £1,260,000 last year it was approximately £3,200,000. On the credit side of the health balance sheet he could say that motherhood was safer than for sixteen years inasmuch as the maternal mortality rate per 1,000 live births was the lowest on record since 1922. Infant mortality was low. The tuberculosis crude death rate continued to decline having fallen from 718 per 1,000,000 persons in 1935 to 693 in 1936 the lowest rate hitherto recorded. There had been a steady decline in the mortality from infectious diseases. There had also been a substantial decrease in the prevalence of diphtheria.

But there was another side to the health balance sheet. Cancer though many more lives were saved to-day by early diagnosis still remained one of the most deadly enemies of mankind and the heaviest single item on the debit side of the health balance sheet. It was true that diseases of the heart and circulation system headed the list but this of course might result from a number of various causes. Colds and influenza still accounted for nearly a quarter of the absence from work and while it was true that the influenza epidemic last year was not as bad as the one in 1936 it was still a heavy item on the debit side of the health balance sheet. The committee on the health balance sheet was likely to be asked to consider the health balance sheet for 1937.

POPULATION PROBLEMS

The estimated mid year population of England and Wales in 1936 was 40,839,000 and this figure showed an increase of 194,000 over the estimated mid year population figure in 1935. The total number of births was 605,292, the birth rate per 1,000 living being 14.8 which was 0.1 per 1,000 higher than the birth rate for 1935 and 0.4 above that of 1933 which was the lowest on record in this country. The total number of deaths was 495,764 and the crude death rate per 1,000 of the population was 12.1 which was 0.4 per 1,000 higher than for 1935 and 0.7 above that of 1930 which was the lowest on record. Certain facts concerning population were already known but before they could properly consider the problem they would need to know many more. The birth rate which stood in 1875 at 35.4 per 1,000 living had fallen to 14.8. He was told that mothers of to-day had about half the children that their grandmothers had and they knew that in the next fifteen years the total number of children aged 5 and over in public elementary schools might fall by as much as 1,000,000. Our population in the immediate future would contain a much larger proportion of older people. They could not of course say whether these conditions would all continue. It was not necessary to be pessimistic about the matter for instance as to whether they would have to take into account a stationary or a declining population.

At present there were two inquiries in progress one by the Registrar General and the other by the Population Investigation Committee a voluntary body under the chairmanship of Professor Carr Saunders. There was already close co-operation between the two inquiries. It was already apparent in the opinion of all these investigators and of many other authorities, that before this matter could be adequately dealt with either by them or us had been suggested by a Royal Commission further steps would have to be taken to make available certain new facts and statistics. Present methods of obtaining and keeping important vital statistics were unsatisfactory and incomplete. Further information was undoubtedly necessary in connexion with fertility. The existing birth rate figures showed the children born of the population as a whole but fertility statistics must relate to the births of particular parents, and show what kind of parents and under what conditions they produced many or few children. Other particulars wanted were the ages of the parents, the date or duration of the marriage, the orders of births and matters of that kind. If these facts were available it would be possible to investigate much more adequately the conditions and circumstances which appeared to encourage or discourage the production of children. He was considering the best steps that could be taken so that these particulars could be obtained with due regard to their confidential and personal nature.

HOUSING

Turning to housing Sir Kingsley Wood said we had had another successful house-building year. The provision of decent and better houses had been the greatest contribution which this generation had made to better health and living conditions. The 3,000,000 mark of new houses built since the war had long been passed. Since that time some 12,000,000 persons equal to 30 per cent of the population, had moved to new homes. So far as housing last year was concerned there was a record total with the erection of 346,000 houses compared with 325,000 the previous year, and 329,000 in 1934-5. The loans sanctioned for housing purposes in 1936-7 were over £33,000,000 compared with £25,000,000 in the year before. Demolition was proceeding on parallel lines, and proposals for clearance and the building of new houses were being prepared at a rate which should ensure the maintenance of the building programme at the same level during the coming year.

Rural district councils were at present concentrating on slum clearance and increased attention was being paid to it. It had resulted in the original slum clearance programme for rural district councils being increased by approximately two thirds. There was almost as big a slum problem in the rural areas as sometimes there was in the towns. The present programme covered some 55,000 houses of which nearly

23,000 were to be dealt with in clearance areas. Some 17,000 houses were already in areas which had been declared over 15,000 were covered by orders submitted to him and nearly 12,000 were in orders which had been confirmed. A total of 28,000 new houses had been built or were under construction to replace unfit houses. In many areas schemes for abating overcrowding were proceeding concurrently with the erection of houses for slum clearance. The renovation and bringing up to date of existing country cottages under the Housing (Rural Workers) Act was important. While the measures in hand for improving rural housing conditions were as much as could be carried out at the moment within the limits of the building industry the Minister had asked his Central Housing Advisory Committee to consider further steps in rural housing. He hoped soon to receive their report and then to consider what further action might be necessary in the light of that report.

RESULTS OF THE OVERCROWDING ORDER

The fixing of the appointed days—the date from which the new overcrowding provisions were to operate in particular areas—was proceeding steadily. Up to the end of March orders had been issued for fixing the appointed day for 1,484 local authorities out of a total of 1,536. The appointed day would be fixed for practically every one of the remaining fifty-two authorities before the end of the year. The abatement of overcrowding did not await the fixing of the appointed day. The amount of overcrowding had been substantially reduced in many parts of the country since the time of the overcrowding survey.

March 31 of this year marked the end of the fourth year of the five year programme of slum clearance. It had more than kept its promise. Four fifths was represented by 166,000 houses and already the houses in submitted orders and purchase agreements exceeded that number. Progress was in fact better than the figures indicated. The original programme had been constantly extended in many areas and at the end of March the revised slum clearance area programme in this country stood at 265,000 houses compared with 207,000 houses an increase of 28 per cent, while the number of houses to be dealt with under individual demolition orders had grown from 72,500 to 110,500. The total revised programme was now 375,000 or an increase of 34 per cent.

The Minister was considering again in conjunction with his Town Planning Advisory Committee the adequacy of present powers and whether anything further could be done in that connexion. With regard to town planning in London the local authorities concerned had been invited to co-operate in the establishment of a new joint standing committee, which he hoped would be set up in the very near future. He would be asking the House at a later date to approve the extension of the present rates of subsidy both for slum clearance and the abatement of overcrowding so as to apply it to houses completed by December 31, 1938. This would extend the operation of the present rates, which were fixed by statute for houses completed up to March 31, 1938 for a further nine months. When he came to review the position he would approach the matter with the view that the completion of slum clearance and the abatement of overcrowding were vital elements in the health services of this country and that the new houses provided for this purpose must be let at rents within the means of those who occupied them.

GENERAL NUTRITION

Nutrition was playing and must play an increasingly important part in health provisions and plans, but while food was important and vital good nutrition was also a matter of good housing, open spaces, good sleep and rest, and proper exercise. Following the report of the Nutrition Committee last April the Minister asked the maternity and child welfare authorities to review their arrangements for the supply of milk and meals to nursing and expectant mothers and young children. Already one fifth of the authorities had replied and many were now taking steps particularly in cases where the supply of milk had been restricted to expectant mothers in the last two or three months of pregnancy and in the case of children where it had been restricted to those of very

young age. A number were extending the service to cover the whole or the larger period of pregnancy and to include more children under 5 years of age. In addition the quantities of milk supplied were to be increased and the payment required from those recipients of milk who could afford to make some payment were in a number of areas to be fixed in the future on a more favourable scale, to ensure that all mothers who could not afford to pay for full supplies of milk should be able to take advantage of this arrangement.

DECREASE IN MATERNAL MORTALITY

The fight to reduce maternal mortality was a particularly stern and difficult one. In comparison with other countries our rate was not a specially high one but for a long period it had not substantially varied. After reading the report of the Department's investigators he had come to the conclusion that a proportion of the deaths that take place in this country were preventable. The rate fell in 1936 to 3.81 per 1,000 live births, which was the lowest figure since 1922, and this was the first year since 1924 that the figure had been under 4 per 1,000. The recent report showed that the main line of attack on maternal mortality must be the continuous improvement of the local maternity services, the keynote of which was the necessity for team work. From the proposals which had been submitted by the local authorities it could be said that satisfactory arrangements were being made under the Midwives Act in the greater part of the country. Important steps were being taken in the training of midwives and the number of ante-natal clinics had increased by seventy-six during the past year. There had also been an increasing number of mothers attending these clinics.

Infantile mortality in England and Wales had fallen to 59 per 1,000 births, which was only slightly above the low record rate of 57 in 1935. There was a steady increase in the number of children under 1 year brought to the infant welfare centres. The importance of the fullest supervision over the health of children between 18 months and 5 years had been emphasized to local authorities and there had been a substantial increase in the number of visits paid by health visitors to such children. As a result of this representation at least forty-seven authorities had established special clinics for toddlers and fifty-three had arranged for the school medical services to be available for the younger children while sixty-four had appointed additional health visitors. Although we had perhaps the finest social services in the world they were by no means fully utilized. It was regrettably a fact that nearly one-half of the expectant mothers had not been brought within the scope of the ante-natal services. It was also regrettable that there were still areas where the majority of parents had not taken full advantage of the services provided under the maternity and child welfare schemes for the benefit of their children. With regard to tuberculosis local authorities were steadily improving the provision for diagnosis and treatment but a large number of patients only came under the purview of the service when the disease was too advanced to make recovery probable. The Minister hoped in the course of this year in association with the Board of Education and the Central Council for Health Education to organize a national campaign to bring these health services more to the notice of the people. The keynote of the campaign would be "Let your Health Services."

which Sir Kingsley Wood had mentioned. He hoped that before it was too late the Minister would turn his mind to the planning of satellite towns and the location of industry. Something should be done also to provide facilities for recreation and breathing spaces within London and other large towns. Whenever there was a clearance and rebuilding scheme some part of the ground ought to be scheduled as a public open space. Referring to the question of public abattoirs he said that there were 15,000 private slaughterhouses and 120 public slaughterhouses were provided by local authorities. In London there was only one public abattoir in the Caledonian Road but there were a number of small ones. Slaughtering on a large scale should only take place in the slaughterhouses provided by public authorities or institutions like the co-operative societies. The others were of such a character as to make it very doubtful whether the ordinary rules regarding cleanliness and so forth could be observed. He hoped the Minister would consider at some time bringing forward proposals to deal with this matter.

Mr. HAMILTON KERR said that there was still very little supervision of the child between the ages of 2 and 5 years in this country. That was the chief gap which existed in our health services. Either in a local centre or in the headquarters of a town a properly organized file of the entire health history of each boy and girl should be readily available. Only by being aware of the total medical history from the age of 1 to 16 could a doctor hope to deal efficiently with a case before him. Mr. LANSBURY contended that the necessity for the services controlled by the Ministry of Health arose very largely because of poverty and until poverty was dealt with we should not make true progress. Until children could get within their homes all the food necessary for them we should not obtain that healthy virile youth population that we all wanted to see.

Mrs. TATE hoped the Minister would set up a committee to inquire into the desirability of voluntary or compulsory notification of venereal disease. She asked the Minister last year if there might be a more careful inspection of nursing homes. She pointed out that in many nursing homes there were still draperies and hangings which spread disease. Careful inquiries might be made into conditions ruling at some nursing homes to see whether they did in actual fact receive what might be called normal illnesses and whether there was not great ground for believing that curious and very undesirable practices were going on in places which were called nursing homes.

NON-TUBERCULOUS WORKERS AT SANATORIA

Mr. ROWSON said that in his constituency there was considerable complaint about the way in which posts under the Midwives Act were being advertised. The secretary of the local midwives association had sent him twelve newspaper cuttings of advertisements for persons to fill the new positions and in every case there was emphasis on the applicant being a State registered nurse in addition to being a midwife. The Minister would do well to call the attention of local authorities to the point that these advertisements were misleading and that all due consideration should be given to the woman who had the single qualification.

He accepted the statement of the Minister in regard to tuber-

He agreed that the numbers suffering from tuberculosis were falling considerably but in England, Wales and Scotland from 1926 to 1935 inclusive 390,516 people died from tuberculosis. In England and Wales alone according to last year's records there was a total of 29,201 deaths from pulmonary tuberculosis and non-pulmonary tuberculosis. This meant that in England and Wales alone 562 people a week or eighty people a day died from tuberculosis. There was reason for the most serious consideration of this matter and for the finest research we could employ to try to cut down this terrible scourge. One of the means by which we should be able to combat this disease was by the better housing and feeding of the people.

THE NEW OPHTHALMIC BENEFIT REGULATIONS

SIR FRANCIS FREMANTLE drew attention to the proposed additional ophthalmic benefits, a subject on which he had received a number of telegrams during the debate. It was a most important subject and he was not going to take sides one way or the other. He was bound to tell the House however of the feeling of those most qualified obviously to know the danger that existed in the examination of eyes for spectacles by opticians who however eminent had not the qualifications to detect serious illness at the back of the eye. There was a doubt in people's minds whether it was right that additional benefit should be allowed from the National Insurance Fund for opticians to prescribe spectacles. Obviously it was the most convenient thing to be done from the point of view of the superficial provision of spectacles.

The Departmental Committee on the Causes and Prevention of Blindness in 1922 stated quite definitely that "an official Register of Opticians would tend to mislead the public into thinking that registered opticians were competent to discharge functions which belong only to those who have had a medical training." Again a Departmental Committee in 1927 said "We are not satisfied that even those opticians who are most highly qualified in all other respects are sufficiently trained in this respect. These two bodies, therefore had taken the view that it was dangerous to allow this additional benefit to be given to a register of opticians but apparently the Minister of Health was about to make a new departure and to allow a register of these opticians to be made out. This would certainly have the effect that people going to members of the register would think that they were going to persons who were competent to prescribe as regards the trouble to their eyesight. There was thus to be said in 1927. The ordinary medical practitioner had not then any real provision to be able to deal with this question but panel practitioners had taken the matter in hand recognizing the difficulty of meeting the need of the insurance beneficiaries. There was the Association of Dispensing Opticians, and the National Ophthalmic Treatment Board had been set up with inclusive charges well within the means of those whose family income did not exceed £250 per annum. If that was so and if that was sufficiently widespread over the country, it was a dangerous thing to allow this additional benefit to be given merely for treatment by those who were not qualified to find out the trouble at the back of the eye and it was another instance where the public might be put upon in some cases by those who were really not qualified to give advice.

The case for satellite cities in general was agreed. Sir Francis continued but the real difficulty was to get them accepted and put into effect by local authorities. The London County Council said that although they had all the trouble involved in making a satellite city it would only account for a very small number of the people with whom they have to deal, that London was migrating 100,000 persons every year into the surrounding country and that if they were dealing with that number every year what was the good of little garden cities that would only deal with 50,000 or 100,000 altogether and take years to establish? That viewpoint mistook the real intention of the whole garden city campaign. It was not simply in the establishment of a garden city here or there, although that would be the ideal, but it would be in the adaptation of the whole town planning movement in that direction.

NOTIFICATION OF VENEREAL DISEASE

SIR FRANCIS endorsed the plea made by Mrs. TATE as regards the Scandinavian experiment in the treatment of venereal disease. The position required to be argued he said because it was quite clear that that experiment had resulted in a position of almost complete immunity from syphilis and a very large reduction of venereal diseases generally. Largely it was claimed by compulsory methods. Undoubtedly we had improved matters here with the inception of treatment centres but the fact was that a large number of persons failed to use the treatment to the finish. Of nearly 50,000 persons who were discharged last year from the venereal disease clinics only 22,000 had the final tests and nearly 20,000 ceased to attend before completion of treatment. What was the result? They went out to infect the community and in many cases brought into the world infected children. There was not nearly enough education in this matter and the Ministry of Health ought to exercise more pressure on the local authorities to keep up their quota of subscriptions to the Social Hygiene Council, that had been entrusted by the Government in successive years with this particular service. We should consider very seriously the question whether it was not necessary to introduce some kind of compulsion either as regards notification or as regards the completion of treatment—treatment to a finish. He did not believe the case was proved as the American Commission's report would suggest for the adoption of a compulsory system but it was foolish to blind our eyes to the results that had been obtained in Scandinavia—results which apparently we could not equal in this country. A Commission of Inquiry should be set up, it would give valuable results.

A CAMPAIGN AGAINST RHEUMATISM URGED

MR J. HENDERSON said that several Continental countries had outdistanced this country in the treatment of rheumatism. He urged the Minister to organize if possible a national service of municipal clinics in conjunction with the local hospitals, where manipulative and other treatment could be given.

MR G. GRIFFITHS urged the Minister to deal with burning pit heaps in mining districts the fumes of which caused ill health. Last year he had asked a question about the wives and dependant children of State-insured persons being allowed insulin free of charge. If the wife of a State-insured person was a diabetic and was prescribed insulin, which cost anything from 10s to 18s a week she could not, if her husband was working, no matter what his wages, get any money with which to purchase the insulin. Only ten days ago he visited in his own village a woman who had to spend 17s 6d. a week on insulin, because since her husband was earning £3 a week she could not get any from the public assistance department.

MR GODFREY NICHOLSON said that it was felt by some that the Ministry was losing a sense of proportion with regard to maternal mortality. They felt that too much stress was being laid on ante-natal treatment and not enough on the importance of skilled attention at the actual time of birth. One eminent gynaecologist had written recently "If the discussion money, and thought which have been devoted to ante-natal care in its relation to mortality during the last few years had been expended upon intra-natal care we should be able now to claim that definite progress had been made. If this suggestion is correct the answer to the question, 'How can maternal mortality be reduced?' lies in improvement beyond all measure in the standard of treatment given to the woman in labour not instead of but in addition to the efforts that have been made in the direction of ante-natal care. It is the specialist who should be looking after the actual confinement and the practitioner doing the ante-natal care. Childbirth was a major surgical procedure and the Minister should bear that point of view in mind. The solution of the problems of maternal and infantile mortality lay in educating the lay population."

MISS WARD referring to the proposed campaign of Use your Health Services asked if the Minister was absolutely satisfied that he had in his possession a detailed statement of the provision of health services as apportioned out by all the various local authorities? Before embarking upon a

campaign of 'Use your Health Services' it was important to know whether there were adequate health services provided by every local authority and also whether they had the necessary finances to enable them to take advantage of the powers conferred upon them.

GOVERNMENT REPLY

Mr BERNAYS replying to the debate referred to the figures given in the latest annual report of the Chief Medical Officer of Health of the Board of Education. He said that they showed that out of 1 680 000 school children examined only 0.7 per cent were suffering from definitely bad nutrition and only 10.6 per cent from subnormal nutrition. There was also the encouraging fact which gave the lie to the assertion about the deterioration of our national physique that the general death rate had fallen by one third during the last twenty-five years and that the death rate from tuberculosis in children under 1 year of age had been reduced by a half in the same period. Malnutrition was a problem and the Government could legitimately claim that it had been tackled with energy and effect in the last few years. The question of satellite towns was dealt with by the Departmental Committee on Garden Cities and Satellite Towns appointed in 1924. The recommendations included the establishment of a National Planning Board. The main suggestion in regard to these satellite towns was that the larger local authorities at the appropriate stage should be encouraged and if necessary, compelled to make further outward development in the form of planned units outside the town separated by adequate areas of open land. What the Government had been asked to do to night was to develop that system and to carry out those recommendations. The instances of Welwyn and Letchworth garden cities had been raised and the Government had been asked why we cannot apply experiments of that kind. These garden cities were started by public utility companies and the suggestion made was that these garden cities should be established by local authorities. That was quite a different thing. It would be quite contrary for London—to take an example—to establish an administrative council in Hertfordshire which would in fact be an urban community surrounded by another administrative council. The operations which local authorities were carrying out were doing much to secure the objects which members had in mind.

Objections had been taken to the recognition of opticians as having power to prescribe for defective eyesight. While the Minister was satisfied that the ultimate ideal was that all persons should go to a medical eye specialist, he was satisfied that it would not be practical politics under present conditions to make this an invariable procedure in all cases. The reasons were that the supply of qualified medical men was not sufficient to meet the needs of the whole population and that the people had not been educated up to recognizing the advisability of this course in what they regarded as ordinary straightforward cases of defective eyesight. The Regulations therefore provided for either of the alternative courses being followed. Every insured person was required to visit his own optician before his application for ophthalmic treatment was granted.

The amendment was rejected and the debate on the Bill as to the Ministry of Health adjourned. Subsequently it was announced by Mr Chamberlain that the debate on the Estimates of the Ministry of Health would be resumed on June 16.

Prison Expenditure

The Estimate for salary and expenses for the Prison Commissioners and expenses of the prisons in England and Wales was brought up before the House of Commons in committee on June 4. Sir SAMUEL HOARE made a statement on Home Office policy in respect of prisons. The problem of to-day was the problem of the young prisoner and how to prevent him going back to prison. In practice it had proved better to give a man privileges when he entered prison and appeal to his fear of losing them rather than to start him with none in the hope of getting something better later if he behaved well. The more humane prison administration had become the lower had been the number of habitual criminals. For some time the Home Office had tried the experiment of appealing to the prisoner's better instincts and giving him an interest in the things which really mattered in the world. An experiment in prison administration was being made in Wakefield, where between 400 and 500 men were trained under conditions of greater freedom and responsibility. The Prison Commissioners had established a camp of wooden huts, where selected prisoners lived and worked on the reclamation of scrub and woodland. This hard and healthy existence better prepared them for life in the outside world than did life within the limits of a prison cell.

Sir Samuel said that in years to come the Home Office must carry further the classification of offenders. Under the 1933 Act a great deal was done for children and young persons. They would have to consolidate their efforts more than at present on the next class of offenders, the adolescents and list of all the habitual criminals. He intended while at the Home Office to look into the question of further classification, and further legislation might be necessary. It was new interests that men and women prisoners chiefly wanted to get their minds away from morbid contemplation of the past and to get them interested in their work and in their physical health. The greatest prison reform was the reform that kept people out of prison. What chiefly mattered was the general raising of the standard of life—mental, physical and moral—outside prison walls. The problem which the House was discussing was only one part of a field of social reform, which included housing conditions and the campaign for greater physical efficiency.

Mr RHYES DAVIES moved a reduction of the vote. He said classification of prisoners according to their criminal record was not enough. There ought to be another classification according to mental and physical standards. In 1913 out of 100 000 of the population 555 were in prison. In 1930 there were 143. In 1935 the figure was 114, and in 1937 it might become less than 100. While there was a reduction in the adult prison population in relation to men and women only one seventh of that population were females. There was also a reduction in the criminal statistics relating to boys and girls in Borstal institutions but the decline in criminality among youngsters was not as steady as among adults. It would not be possible to do much more to help prisoners so long as the old prison buildings remained. When a man went to prison for ten or fifteen years the social insurance schemes were never available to him again. The House had not yet the report of the Prison Commissioners for 1936 and he could not understand why the reports were not available earlier. The previous report stated that four men and ten women were released on medical grounds. He would be happy to be assured that no babies were now born in prison.

MEDICAL EXAMINATION OF CRIMINAL LUNATICS

Mr RITSON said many appeals had been made to have a medical examination of a man who had been thirty-five years in Broadmoor as a criminal lunatic. So far as Mr Ritson knew no such appeal had ever been granted in this country, but the Home Office had now agreed that there ought to be facilities of that sort. When anyone had been locked up under conditions like these for such a term there ought to be an opportunity for examination. The notion was now

endeavouring to make mental institutions brighter and this should be applied also to prisons

Mr GALLACHER said flogging was terrible but was nothing to compare with the torture of the dark and silent cell. Some prisoners were nervous and irritable. If they made some retort to a warder they were reported and sent to the silent cell. Everything was taken out of the cell except the stool and they had to sit on that stool or walk about all day and all night. He had seen prisoners come out with their heads trembling and without any control over themselves. The solitude and silence threatened a man with complete mental breakdown.

Mr GEOFFREY LLOYD said the points made by Mr Ritson and others in speeches would receive special attention. The decline in the prison population was satisfactory. Last year the average population in all establishments was about 10,000 and the present population was about the same. The numbers had decreased since 1932 and one reason was the Money Payments Act. The extended use of the system of probation also had an effect on the prison population. The decline in prison population was most marked among women. The daily average population of women prisoners in 1910-11 was 3,581 but on June 1 1937 it was only 685. The figure for Borstal reached its peak in 1934 when there were over 2,000 inmates. From that the figure fell for a short time but was now steadily increasing and was well over 1,800 because of the increase in the age group with which Borstal was concerned. The Institute of Industrial Psychology had assisted the work of the Borstal institutions and had worked out a system of examination of individuals to help in deciding for what work they were fitted. The Home Office made a practical test with regard to the work that the boys did, and was arranging to train house masters in carrying out these tests.

With regard to other classes of prisoners the condition that hard labour prisoners must spend fourteen days without a mattress did not apply now to those who were aged or medically unfit. This matter was governed by statute and the Prison Commissioners were not free to make a change without the consent of Parliament, but the Home Secretary would consider it and other matters when the question of legislation arose. Mr Rhys Davies had referred to the Belgian experiment with young prisoners. The Home Office however did a good deal in this matter. After being sentenced all Borstal boys were collected at Wormwood Scrubs and examined on their antecedents and mental and physical circumstances before deciding to which Borstal institution they should go. When the court asked for a special report or when the Governor asked for a special examination it was always carried out. Observation and examination were made the basis of treatment. The motion for a reduction of the Estimate was withdrawn.

APPROVED SCHOOLS

The vote for approved schools in England and Wales was then brought forward, and Mr SHORT moved to reduce it. He said that up to 1928 reports were issued which gave a clear idea of the progress of administration in these schools but these reports were no longer issued. He hoped the Home Secretary would take immediate steps to ensure that some report was issued on this problem. On September 30 1936 there were 7,927 children in these schools against an average daily prison population of 11,306. A very large number of young offenders were drafted into these schools. In 1935 69,849 persons were found guilty of indictable offences. Of these 25,543 were under the age of 17. Of offenders under 17 9 per cent were sent to Home Office schools 51 per cent were placed under probation officers 8 per cent were bound over without an order for supervision and in 24 per cent of the cases the prosecution was dismissed. The figures for 1936 were not available but he surmised that there had been an increase in the number of juvenile offenders and that a larger percentage had been sent to approved schools. There were some eighty-seven approved schools and from 1930 to 1936 there had been a consistent increase in the number of children ordered by the courts to go to these schools.

Sir SAMUEL HOARE gave an assurance that in future there would be a regular report upon these schools. It was difficult to define the reasons for the increase in the number of children sent to them. The existence of juvenile courts and the greater interest taken in the condition of children might have led to that increase or there might be greater temptations for children to commit some offences. In his latest report the Commissioner of the Metropolitan Police drew attention to the fact that a large number of offences were committed by children of 13. The Home Office was not satisfied with the present position. It had not sufficient accommodation for the increasing number, and from time to time children had to be sent to remand homes and kept there much longer than could be desired. The schools as a whole turned out a good type of boy and girl, and the boys and girls made good in after life.

Mr GOLDIE remarked that boys in approved schools although 99 per cent of them came from industrial areas received an agricultural training, and he believed that a good deal of recidivist juvenile crime was because the boys found they could not compete in the labour market against those who had received an industrial training.

Mr GEOFFREY LLOYD said that in 1928 the percentage of children found guilty in the juvenile courts was 9.75 and in 1935 it was 9.21. Broadly speaking there was no evidence that the courts made increased use of this method of dealing with juveniles. The talk about a wave of juvenile crime was loose and unjustified. They were experiencing at the moment a considerable rise in the juvenile population and owing to the Children and Young Persons Act 1933 there was less reluctance to bring cases of juvenile delinquency before the courts.

The motion to reduce the vote was withdrawn and progress was reported leaving the vote open.

Health and Medical Care of Spanish Refugee Children

On June 7 Miss CAZALET asked the Minister of Health what was the present position regarding the health of the Basque children who had been brought into this country. Mr BERNAYS replied that the general health of these children was satisfactory but it was desirable on grounds of public health that the number of children in the camp at North Stoneham should be reduced as speedily as possible. The National Joint Committee for Spanish Relief was in accord with this view. Evacuation was in progress and about 900 of the 4,000 children had already been transferred elsewhere. Five cases of typhoid fever, two cases of diphtheria, and three cases of measles had occurred among the children. The patients had been isolated and appropriate precautionary measures had been taken against the spread of infection.

Captain BALFOUR asked whether if he gave the Minister any information from local residents that there were no adequate medical arrangements and that many of the helpers had no knowledge of the language at all he would take notice of that information. Mr BERNAYS said he would be glad to have any information which Captain Balfour could give him.

Mr D ROBERTS asked if it was not the fact that there were five full-time fully qualified doctors, matrons, a large staff of nurses and a staff of local V.A.D.s in the camp.

Sir FRANCIS FREMANTLE. Would not the care of these children naturally come under the local sanitary authority and the local medical officer of health and if the latter was not able to act for reasons of other functions and duties would they not come naturally under the care of a direct officer of the Ministry of Health?

Mr BERNAYS. An officer of the Ministry of Health is constantly visiting the camp and sending reports to the Ministry on the subject.

On June 8 it was announced that the Minister of Health was not aware that any instructions were given or any request made that the children from Bilbao should be vaccinated or inoculated before reaching this country.

Animal Diseases Government Policy

On June 7 the House of Commons in Committee of Supply, considered the Vote for the Ministry of Agriculture and Fisheries. Mr W S MORRISON in reviewing the work of the department, said that the milk scheme had so far rendered possible a start on the great question of improving the quality and increasing the consumption of this vital food. In the last financial year the amount of milk sold in the liquid market increased by 12,500,000 gallons, and the quantity for manufacture had increased by 8,000,000 gallons. There had been an immense increase in the number of persons producing milk of an accredited standard. Before the scheme was introduced there were only 800 Grade A licencees but now there were nearly 20,000 producers of milk of accredited standard.

With regard to poultry disease, the Technical Committee which had been set up was considering the present methods of distribution of hatching eggs, day-old chicks, and feeding stuffs. Strenuous efforts were being made to lessen the toll of mortality among the chickens. Research into the pathology of diseases which had caused the losses among poultry was being continued by the scientific bodies concerned. Any further measures which might be taken would be of an administrative character when the new central veterinary service came into being.

Referring to the immense burden of animal diseases, which cost the industry something like £14,000,000 a year he said that a great deal of work had been done in the past by local authorities and by the Ministry's veterinary service, and practical results had been obtained. During the last financial year there were thirteen centres of infection from foot and mouth disease and these comprised sixty six separate premises. The policy which had been carried out had had the result that the disease had not become endemic in this country as it had in some other countries. There was a slight increase in the incidence of anthrax, but a satisfactory decrease in swine fever and sheep scab. There were still diseases like tuberculosis, contagious abortion mastitis, etc., which took an immense toll of our cattle. The proposals which he had recently announced would involve legislation, and represented a very much bigger step forward and a much more resolute attack on this problem than had yet been made. He hoped with the co-operation of those concerned, that it would yield substantial results in freeing the industry from a wasteful burden.

Scientific Personnel of Ministry of Health

On JUNE 8 Sir KINGSLEY WOOD informed Mr Markham that on April 1 1937 the scientific staff of the Ministry of Health other than the medical and dental staffs, totalled thirteen. This figure included a chemist, chemical inspector, alkali inspectors and pharmacists. The corresponding figure at April 1 1930 was thirteen. The medical and dental staffs at the same dates were respectively medical staff 1930 104 and 1937 115 dental staff 1930 12 and 1937 16. In addition the Department's establishment in both years included a post of serologist which was temporarily vacant on April 1 last and would shortly be filled.

Capitation Fee

Mr WILL THORNE asked on June 10 whether the Court of Inquiry had come to any settlement in connexion with the fees to be charged by the doctors when boys and girls became employed after leaving school and whether the Government intended bringing in a Bill to deal with the matter?

Sir KINGSLEY WOOD answered that the Court of Inquiry which was asked to consider the doctors' capitation fee to be paid as from January next for all insured persons entitled to medical benefit on the assumption that employed juveniles would then be included had reported in favour of the present rate of nine shillings per annum. He would introduce the necessary Bill as soon as Parliamentary business permitted.

Mr THORNE: Is it in consequence of their powerful organization that the doctors have got all that they wanted?

Sir K WOOD: I would advise the hon gentleman to consult the doctors.

Tuberculin tested Herds—On March 31 last there were 1,795 herds in England and Wales licensed for the production of tuberculin tested milk. There are at present in England and Wales 293 attested herds (which are tuberculin tested) on the register kept by the Ministry of Agriculture. This number includes eighty four herds which are also licensed for the production of tuberculin tested milk.

Minimum Income and Nutrition—On June 7 Mr SANDYS asked the Minister of Health whether the Government accepted Mr Seebohm Rowntree's recently published estimate of the minimum income required to provide the essentials of life, to which his attention had been drawn and if not, whether his Department had made any such estimate of its own. Mr BERNAYS replied in the negative. He said that the Minister was advised that this estimate involved certain features that were very conjectural, and no sufficient official material for the preparation of an estimate of this kind was at present available.

Administration of Midwives Act in Glamorgan—Mr EDWARD WILLIAMS asked, on June 9, whether a number of district councils in Glamorgan opposed the administration of the Midwives Act, 1936, by the county council and had asked the Welsh Board of Health to receive a joint deputation in order that the position might be discussed, and that the Department refused to receive the deputation and gave no adequate reason for its refusal. Mr Williams asked Sir Kingsley Wood to direct the Department to receive the deputation. Mr BERNAYS replied that as the question of a local inquiry was involved doubt was properly felt as to the propriety of receiving a deputation. Sir Kingsley was however, asking the Welsh Board of Health to treat the matter specially.

Universities and Colleges

UNIVERSITY OF OXFORD

E. S. Duthie, M.B., M.Sc., Ph.D. Dub., has been appointed University Demonstrator in Pathology for four years from October 1 1937.

The name of S. Zuckerman, M.A. M.R.C.S. L.R.C.P., of Christ Church has been added to the list of members of the Faculty of Medicine.

Dr A. G. Gibson, F.R.C.P., has been constituted Nuffield Reader in Morbid Anatomy while holding the office of honorary pathologist at the Radcliffe Infirmary, from October 1, 1937.

UNIVERSITY OF CAMBRIDGE

At a congregation held on June 11 the following medical degrees were conferred:

M.D.—F. W. Shepherd, T. R. Thomson, E. W. Taylor.
M.B. B.Chir.—*D. G. Lewis, *N. B. Betts, *G. Rigby Jones, S. C. Buck, G. E. Loxton, A. E. M. Hartley, A. J. Moon, R. G. Pulvertaft, J. H. Lankester, F. S. A. Doran.
M.B.—*K. G. F. Mackenzie, *T. V. Tattersall, J. S. Ellis, A. L. Jackson, H. S. Mellows, J. M. Scott, E. F. W. Grellier, A. W. B. Rostrom.

* By proxy.

UNIVERSITY OF MANCHESTER

Dr Frederick Hall has been appointed Lecturer in Public Health Administration.

UNIVERSITY OF SHEFFIELD

At a meeting of the University Council, held on June 11, Dr Gilbert Forbes was appointed Lecturer in Forensic Medicine and Dr J. M. Kennedy Lecturer in Infectious Diseases in the place of Dr J. Clark, resigned.

UNIVERSITY OF WALES

The following candidates have satisfied the examiners in the examination indicated:

TUBERCULOUS DISEASES DIPLOMA—A. A. Azcey, M. P. Crowe, B. A. Dornier, M. C. Malkani, C. F. McConn, K. P. R. Pillai, N. N. Sen, H. K. Surveyor, G. R. Talwalker, Heien Turner.

Income Tax

Income From Foreign Estate

Q Z's wife has been left an estate abroad consisting of certain mortgages and house property in addition she was left a large private house which under the terms of the will she is unable to sell and has to maintain. The cost of management and upkeep exceeds the income from the estate. Is Q Z liable for income tax?

Income in the form of foreign mortgage interest falls within a different case of Schedule D than income from foreign rents and there is no right of set off between the two cases. Consequently Q Z is liable to account for tax on the income arising abroad as mortgage interest whether it is remitted here or not but in so far as the foreign rents are applied to meeting the cost of maintaining the property they are not taxable here. Seeing that both forms of income arise from the same testamentary disposition there is a clear hardship and we suggest that Q Z might put the facts before the Board of Inland Revenue (Somerset House WC2) asking that the income should not be divided but be treated as arising out of a beneficial interest in an estate and only the net surplus income (if any) be regarded as liable to assessment.

Private Use of House and Car

M D asks what proportion of the running expenses of a car is usually regarded as for private use where the annual mileage is say 11,000 miles and also whether the local inspector of taxes is right in excluding from the house repairs claim any expenditure which would be carried out normally by a landlord.

It is impossible to suggest a ratio for private use of car as so much would depend on circumstances—for example use during holidays—but 10 to 15 per cent is not uncommon. With regard to the house we disagree with the inspector. As M D owns his residence he is presumably allowed in respect of rent a proportion of the net income tax assessment. Either he should have been allowed a proportion of the gross assessment—that is before the statutory deduction for repairs—or a proportion of the professional assessment plus actual expenditure on the professional portion. The inspector's argument can be carried to a logical *reductio ad absurdum* by applying it to a factory or shop.

Replacement of Car

A B D bought a 14.9 h.p. car in 1929 for £299 and sold it in October 1936 for £27, buying a 13.9 h.p. M car. What can he claim?

As cost of replacement—the cost of the new car less £27—or as “obsolescence allowance £299—£27 = £272 or the cost of the new car whichever is greater. In either case the amount allowable is treated as an expense of the year 1936.

LETTERS, NOTES, ETC.

A Maternity Convalescent Home

Readers may like to know that there is accommodation at Black Lake Home Farnham Surrey for mothers who wish to take an inexpensive convalescent holiday after confinement. This convalescent maternity home which is situated in pleasant surroundings, is for the wives of professional and business men. There is accommodation for five mothers and babies, who receive expert nursing attention. Babies under a fortnight and over 3 months of age are not admitted. The home is not run for profit and the fees are from two and a half to three and a half guineas a week. In cases of special need even lower terms can be arranged.

Nutrition and Health

With a view to bringing that section of the rising generation which is passing through the secondary schools of London into contact with some of the more important aspects of science and its applications the British Science Guild in 1935 organized a new annual series of lectures. The first proved so successful that it was decided to invite the Science Masters Association and the Association of Women Science Teachers to assist in the general working of the scheme as a memorial to the late Mrs. Gabrielle Howard who was deeply interested both in science and in education. The managers of the Royal Institution lent their theatre for the

two lectures for 1937 by Sir Robert McCarrison on Nutrition and Health. Sir Robert McCarrison's lectures were given last month to over a thousand London boys and girls aged 14 and over from secondary schools and have now been printed as a pamphlet in which form they may be commended to the notice of medical students as well as to the general public. Copies can be obtained direct from the printers Messrs Headley Brothers Ashfield Kent at the following rates which include postage—1/0 0/0 6/9 5/6 5/0 7/5 2/5 3/6 9/6 6/15.

Continuity

Dr EDWARD G. WALES of Downham Market, Norfolk sends this interesting note. I am returning from practice at the end of June 150 years from father to son, four generations in the same house without a break. Perhaps this is not a record for country practice but may be nearly so. The practice will now merge with others and I remain in the same house. We have been members of the B.M.A. I believe since its foundation.

Perspective in Medicine and Art

Dr A. D. WILLIS writes. The practice of the medical art need not be fatal to or remote from the appreciation of pictorial art. One might almost say that the two are related now that the psychologists are trying to bridge the gap between the mind of the artist and the created work. In the opening words of his admirable address to the Medical Society of London (Journal May 22 p. 1057) Dr R. A. Young deals with the question of perspective in painting and draws an analogy between its pictorial and its medical usage. But I doubt if the analogy is tenable. Vital though perspective is in any sane approach to medicine I think its discovery as an unmixed blessing to painting is I should not to deprive oneself of a true and eclectic appreciation of art. Theoretically there is no reason why it should not have increased the power of artistic expression rather than change its fashion. Its abuse lay in its being regarded as an end and not as a means in artistic expression. Probably this was a factor in the decline of much good art between the thirteenth and nineteenth centuries. Be that as it may, it enabled the majority of painters during that period—in the words of Dr Johnson—to arrange things in a picture according to their appearance and real situation. I mean it encouraged them to create illusions and to cover their canvases with literary irrelevances and sentimental allusions. Speaking generally one may say that realism became a substitute for the imagined truths and formal integration which the primitives in their innocence could alone conceive. The work of El Greco is like a voice crying in the wilderness against the tyranny of perspective. The impressionists began to see the light but it was left to the post impressionists to realize that to simplify and distort are two great artistic virtues. Whoever doubts all this let him go to the Royal Academy where the illusionists predominate. They are out of touch with the vital streams of art which are now gaining force after prolonged desiccation. It is significant that in the modern movements perspective is being eliminated although design is not a flat pattern. No doubt the perfection of chromophotography although without a free selection of subject, will enable us to view the art since the thirteenth century in its true relations or relative proportions as we strive to view all our medical problems.

Medical Golf

The Manchester and District Medical Golfers Association held its annual competition for the challenge cup at Wilms low on June 9. Dr N. R. Jeffery (Whitefield) was the winner of the cup with a net return of 71 playing from sixteen strokes allowance. Dr W. L. Hunter (Hale) was the winner of the Walter gold medal for the best gross score of the day and also the runner up's prize presented by the captain Dr T. M. Bride. The Walter silver medal awarded for the best gross score among players with handicaps of ten or more was won by Dr G. Ferguson (Oldham) with a score of 84. Dr R. W. Fairbrother of the home club went out in 35 strokes and won the prize for the best outward half and Dr W. S. Nunan (Selford) won the prize for the best homeward score also with 35.

Savory and Moore Ltd 61 Welbeck Street London W1 have been appointed sole distributors in the United Kingdom of the products of E. R. Squibb and Sons manufacturing chemists of New York.

JUNE 19, 1937

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

482 Post anginal Streptococcal Septicaemia

C. H. BIETH (*These Paris*, 1937, No. 261) records five cases in patients, aged from 13 to 30, of septicaemia following an attack of sore throat, the streptococcal nature of which was shown by a blood culture. The condition presented the following characteristic features. There was an interval of varying duration between the initial pharyngeal affection and the stage of septicaemia, there were few physical signs, apart from a usually moderate splenomegaly, in contrast to the severe constitutional disturbance accompanied by high fever and shivering, secondary visceral and articular localizations were rare, and there was a tendency to relatively rapid spontaneous recovery. Therefore, in the presence of any sore throat accompanied by some constitutional disturbance, especially in a young adult, the possibility of septicaemia should be considered and a blood culture taken.

483 Malingering

W. SCHÖNFELD (*Derm. Wschr.* April 3, 1937, p. 417) believes that because the malingerer's methods are not sufficiently widely known many cases are unrecognized. The simplest method adopted by malingerers is that of producing ulceration, usually below the knee, by the application of irritants or the subcutaneous injection of paraffin, turpentine, benzine, etc. Cases are on record in which conscripts, beggars, and patients awaiting compensation have simulated by these means leprosy, favus, scurvy, crabs, tuberculosis, and pemphigus. The production of "haemorrhage" from the genito-urinary tract by the ingestion of dyes, balsam of Peru, or rhubarb, or by injection of blood into the bladder, or by inflicting trauma to the urethral mucous membrane, is another favourite method. Malingerers sometimes make use of a hydrocele by injecting air or fluid into the scrotum or by the external application of turpentine or irritation by wasp stings. Simulation of venereal disease became a fine art in all armies in the war. One German author estimated that 5 to 7 per cent. of all cases were malingerers. Chronic gonorrhoea is more easy to simulate than the acute form because of the ease with which the latter is detected bacteriologically. Use is made of acids, alkalis, soap, and tobacco juice in the production of a discharge. Chancres occur after the application of irritant ointments or plant juices, "condylomata" may be produced by cantharidin plasters, "tertiary syphilis" by alkali burns. Orchitis and epididymitis have been caused by the subcutaneous injection of paraffin and oil paint. Schönfeld points out that the causes of malingering vary with changing need—beggars in the Middle Ages, avoidance of conscription in the war, compensation cases to-day—and that it is therefore the duty of all doctors to become acquainted with simulated disease in all branches of medicine.

484 Infectivity of Old Tuberculosis

P. BIETH (*Disch. Tuberk.* May, 1937, p. 115) has undertaken a special study of a very common form of pulmonary tuberculosis—that in which physical signs and the radiological picture are indicative of open tuberculosis, but in which no tubercle bacilli are demonstrable on microscopic examination of the sputum frequently repeated over several years. The author classifies these cases in two groups according to whether there has or has not a sputum-positive history much earlier in the disease. In the first group, which included twenty-

two cases, there were eight in which animal tests were positive, although tubercle bacilli were not demonstrable by other means. In none of these twenty-two cases could any evidence be found of other persons in the neighbourhood having been infected by them. In the second group, which included eighteen cases, tubercle bacilli had never been found in the sputum, not even quite early in the disease. Animal tests in all these cases proved negative. Most of the patients in the first group were elderly, the average duration of their disease having been sixteen years. The amount of the sputum varied from time to time and was seldom appreciable. Foul breath and clubbed fingers were lacking, and there was little or no change in the clinical picture from year to year. One of the most important public health problems raised by this type of case is the chances it offers of spreading tuberculosis, the author has come to the conclusion that however dangerous these patients may have been to their surroundings early in the disease, their infectiousness must now be considered as greatly reduced. Hitherto he has treated such patients from an administrative point of view as open cases of tuberculosis, but with the conviction that their infectiousness is only slight he has come to regard isolation in an institution as hardly necessary.

485 Pulmonary Aneurysm

A. PORTO (*O. Hospital Rio de Janeiro*, April, 1937, p. 351), who records an illustrative case of aneurysm of the trunk of the pulmonary artery, illustrates the rarity of this condition by the following statistics. A Costa found only one example in 20,000 necropsies. Crisp and Nicolaiew found only two in a collection of 557 cases of pulmonary aneurysm. Pissot in his Paris thesis of 1920 was able to collect only five examples from the world's literature. Porto's case was that of a man aged 62, a syphilitic in whom the clinical diagnosis of pulmonary aneurysm was confirmed by x-ray examination.

486 Hemiplegia Caused by Cerebral Tumours

J.-A. CHAVANY and A. PLACA (*Presse méd.*, April 14, 1937, p. 569) review the subject of hemiplegia caused by benign or malignant tumours of the brain, and base their conclusions on forty-five cases which were verified anatomically or at operation. They find that in many cases cerebral tumours give rise to symptoms of increased intracranial pressure, and it is necessary to make a diagnosis as regards the location of the growth. If the pyramidal tracts are affected there are early signs of motor involvement with irritation followed by paralysis, but there is no increase of pressure. In these cases diagnosis is difficult, as there is no pain in the head and examination of the fundus of the eye shows no abnormality. Radiography is of value particularly in cases of meningioma and angioma, which affect the bony structure. Hemiplegia may develop in four different ways. It may be progressive, and without excitomotor signs, it may be preceded by a phase of variable length, in which crises of Jacksonian epilepsy occur, it may have a sudden onset, or it may be complementary to signs of intracranial pressure. In the first instance the first symptom is hypotony followed by a progressive motor paralysis leading to hemiplegia. In these cases a diagnosis of malignant tumour of the brain is usually made with a grave prognosis. In cases in which Jacksonian fits occur the paralysis progresses slowly and headache is a common symptom. When the hemiplegia develops rapidly with loss of consciousness a vascular origin, such as softening of the brain, may be suspected. The motor loss reaches its maximum in several hours and subsides slowly. If the hemiplegia is due to a tumour, however, it remains unaltered for some time, but diagnosis between these two causes of the

condition is difficult. When intracranial hypertension is present at the same time as the hemiplegia a condition of stasis usually exists, with symptoms of headache and vomiting. Lumbar puncture should always be carried out in cases of suspected cerebral tumour, in order to avoid serious developments.

Surgery

487 Albee's Operation in Children

H BILLET (*Scalpel* Liège April 10 1937, p 450) who has performed Albee's operation in children for over ten years is convinced of its value. He believes it to be necessary in those cases of Pott's disease which run an abnormal course. The operation should be done not in the period of decline as in adults but in the active stage of the disease when other orthopaedic measures fail. He advises it in all cases complicated by abscess formation gibbosity and paraplegia after a preliminary period of complete rest in a plaster jacket until the tuberculous process has become quiescent. Billet always uses bone grafts taken from the patient himself. After operation the patient is immobilized for six months in a plaster corset lying at first on the abdomen later alternatively on his back and abdomen. In the later stages a celluloid corset is worn usually for one year until cure has taken place. When correctly treated, children are left with a supple spine. The author agrees that children with Pott's disease can be cured with non operative measures alone provided that they are under treatment from the beginning to the end of the condition, but in his experience such cases are the exception and it is with the others that he has had excellent results from operation. Billet asserts that the part which the bone graft plays is not purely mechanical, but is biological. He bases his assertion on the fact that Albee's method promotes a cure far more rapid than that obtained by other measures. In many of his cases surgical intervention achieved success when the patients under other therapy were going downhill. In one of his most successful cases Billet was forced to remove the entire graft two months after operation through a fistula which refused to heal. This affords proof to the author of the biological part played by the graft.

488 Whitehead's Operation for Piles

A HERMANNSDORFER (*Med Welt* March 27 1937, p 423) regrets that recent reports have tended to favour the clamp-cautery ligature operation for piles as against Whitehead's operation. The latter, he says is indispensable for the complete ring of haemorrhoids especially when there is prolapse of the anal mucosa the incontinence bleeding and strictures which have been found to follow Whitehead's operation are due to technical errors. It is important (1) to precede the operation by two days fluid diet and the administration of 15 minims of tr opii the night before but to omit purgative measures on the day of operation, (2) to avoid manual or instrumental stretching of the sphincter (3) to incise the mucosa not the skin (4) to insert a tube which should be left for five days after operation, (5) to avoid a motion of the bowels for ten to twelve days by giving tincture of opium in large doses. The introduction of bougies should be practised for several weeks after operation if the resection of a long cylinder of mucosa has been necessary or if the incision has not united primarily. In Hermannsdorfer's series of forty seven cases primary union followed in forty two there was one case of secondary haemorrhage and all those patients who could be traced were satisfied with the result—although a few reported slight difficulty in the retention of watery stools. Ectropia it is stated does not follow unless the operation is wrongly combined with excision of external haemorrhoids and the suture of skin to mucous membrane.

1296 a

489 Operations on the Pulmonary Apex

A OMODEI ZORINI (*Ann Ist Carlo Forlanini* February 1, 1937, p 1) records nine illustrative cases of operative treatment of tuberculous cavities of the pulmonary apices. The operations included simple apicolysis, apical plombage, and posterior apical thoracoplasty, and were performed at the Carlo Forlanini Institute in Rome. Simple apicolysis which was practised only in forty four patients with early cavities of the apex, especially those complicated by haemoptysis, gave good results in 45 per cent. Apical plombage, which has many drawbacks, was carried out in seventeen cases, but good results were obtained in only two. The operation can be used with advantage however in cases with localized stationary cavities of the apex, in obstinate haemoptysis due to adherent apical cavities as a complementary operation to thoracoplasty and in some cases of bilateral apical cavities. According to the writer posterior thoracoplasty is the best method for the treatment of destructive apical processes and must be accompanied by resection of the first two vertebral transverse processes and of the rib below the lower limit of the cavity.

Therapeutics

490 Vitamin B in Insulin Shock

R FREUDENBERG (*Wien klin Wschr* April 23 1937, p 535) draws attention to the parallel between vitamin B₁ deficiency and insulin shock. Experimentally it has been shown that in both conditions there is a lessened intake of oxygen in the grey matter of the brain. Insulin shock therapy in schizophrenia has hitherto been attended by a mortality of 1.6 per cent. In lethal cases the administration of dextrose orally or intravenously has failed to arouse the patient from his coma. Errors of technique have been held responsible for these cases—namely too frequent administration of shocks, too long duration of the coma etc. Freudenberg has found that the administration of vitamins B₁ and B₂ and adrenal cortex hormone has succeeded in interrupting coma in non reversible cases of insulin shock. Patients who previously had wakened with 33 per cent dextrose solution in quantities of 70 to 140 ccm and then failed to do so with 50 per cent dextrose solution (400 ccm), were roused in twenty to thirty minutes by the administration of 800 units of betaxin or yeast emulsion. In other cases it was possible to lessen the hypoglycaemic state before the administration of dextrose. The author claims that the administration of vitamins B₁ and B₂ is a valuable therapeutic agent in making insulin shock therapy safe.

491 Staphylococcus Toxoid in Treatment

W A TIMMERMAN (*Nederl Tijdschr Geneesk* April 17, 1937 p 1725) records his observations on the use of staphylococcus toxoid in various conditions caused by staphylococci, with the following results. In thirty-eight cases of recurrent furunculosis the results were good. In twenty one cases of different forms of acne three showed considerable improvement directly after treatment, nine showed no effect four were moderately and four considerably improved later only one was completely cured. Of five cases of sycosis barbae three were more or less improved, one was cured, and one unaffected. In four cases of osteomyelitis no definite improvement occurred. The initial dose should be small and the doses should be increased slowly a careful watch being kept for local, focal and general reactions.

492 CO₂ Baths in Cardiovascular Disease

W LUEG and H KUHN (*Med Welt* April 24, 1937 p 563) are convinced from a long experience at Bad Nauheim of the psychical benefit to patients suffering from cardiovascular disease of CO₂ baths. Such patients they point

out do not suffer from disease of a single organ, but from damage to the entire personality, and change of environment and balneological treatment appeal to them more than the administration of drugs. CO₂ baths owe their effect to three factors: (1) Immersion of the body in the bath compresses the superficial veins and skin capillaries and induces a centripetal blood flow. The tonus of the heart muscle is strengthened. The static pressure of the bath puts a moderate strain on the circulatory system. It may with advantage in certain cases be lessened by lowering the water column, and by prescribing 'three-quarter' or 'half' baths. (2) The CO₂ spring at a temperature of 35° C gives rise to a pleasantly warm sensation, in contrast to ordinary water at the same temperature. This is due to the insulating action of the fine gas bubbles which settle over the entire skin. The part of the body below the water becomes bright red in colour owing to capillary engorgement. (3) CO₂ is diffused through the skin. At 45° C it gives rise to a lowering of the blood pressure, a slowing of the pulse, an increase of the pulse volume and diuresis. CO₂ baths strengthen the action of digitalis, but cannot be substituted for it. Baths are indicated in cases of heart disease with full or adequate compensation, in cases of 'senile' or 'nervous' heart and in arteriosclerosis. They are absolutely contraindicated in angina pectoris, in cases with a tendency to embolus or thrombus formation, in those with kidney trouble or in febrile cases. Heart failure is not of itself necessarily a contraindication. A course of balneological treatment consists of twelve to fifteen baths with one- to two-day intervals of rest. In each case it must be preceded by a complete clinical examination. The dosage may be regulated by ordering full, half or three-quarter baths.

Laryngology

493 Vitamin C Deficiency in Pharyngitis

M. BARR (*Deutsch. med. Wschr.* May 7, 1937, p. 741) suggests that in most cases of pharyngitis it is impossible to link it up with some definite aetiological factor such as an infectious disease or a poison (lead, nicotine, alcohol, poisonous gases, dust, etc.). Treatment has hitherto been mainly local and symptomatic and it has not been wholly successful. The case which first made the author associate pharyngitis with vitamin C deficiency was that of a woman, aged 38, who on account of intractable vomiting was kept for several days on a much reduced diet. There followed a severe and extensive pharyngitis. Suspecting vitamin C deficiency the author subjected her to the Harris test. The Harris test depends on the identity of vitamin C with ascorbic acid, and on the fact that when there is a lack of vitamin C in the body this acid is retained and not excreted in the urine until this deficiency has been made good. Since this test proved positive the author prescribed a synthetic preparation of vitamin C by the mouth and by injection, supplementing this treatment by a vitamin-rich diet. Thirty-five other cases of pharyngitis were also investigated, and as a result the author attaches more and more importance to the Harris test as a guide to rational treatment in such conditions. He concludes with the generalization that pharyngitis is not a nosological unit but merely a symptom-complex of the most varied aetiologies, and he does not consider that his cases are sufficiently numerous yet to justify any dogmatic claim that his therapeutic successes depended entirely upon his aetiological speculations.

494 Bacteraemia after Tonsillectomy

J. J. HILL (*Nederl. Tijdschr. Geneesk.* May 15, 1937, p. 211) reports on the work of Okell and Elliot on the effect of extra-oral tooth extraction carried out aseptically on 220 children after removal of tonsils. In twenty-four out of 100 children bacteraemia was observed immediately after tonsil

lectomy, whereas before the operation only three gave positive cultures, which were then attributed to focal infection. In another series of 120 children thirty-nine showed a bacteraemia immediately after operation, but four hours later only three showed a positive blood culture. The cultures usually consisted of streptococci, mostly belonging to the viridans groups, or of the haemolytic type. Pneumococci were found less frequently, and staphylococci in only one case.

495 Bronchial Catheterization and Bronchspirometry

P. FRENCHNER and S. BJÖRKMAN (*J. Laryng.* April, 1937, p. 233) define bronchial catheterization as a technical process which makes it possible to analyse the exchange of respiratory air from separate portions of the lungs. A small size bronchoscope is passed into a bronchus. The last 2 to 3 cm of the bronchoscopic tube carry a rubber membrane which can be inflated through a fine tube when the instrument is in place. The inflated rubber membrane occludes the bronchus. The air collected from the proximal end of the bronchoscopic tube measures the gaseous exchanges which take place in that portion of the lung which lies beyond the occlusion. Bronchspirometry is a further development of the method, and allows a volumetric determination and gaseous analysis of the respiratory air of each lung separately. The instrument used is a double bronchoscope with two separate tubes. One tube opens at the distal end with an obturator near the tip. The bronchoscope is passed until the distal obturator lies in the left main bronchus between the carina and the origin of the upper lobe bronchus. The air from this tube indicates gaseous exchanges in the left lung. The other tube opens more proximally just above the carina, and there is a second obturator a little below the glottis which makes an airtight occlusion there. The air from this tube therefore comes entirely from the right lung. Both outlet tubes of the double bronchoscope are connected by rubber tubes to two separate spirometer systems. These are specially designed suction pumps which can take respiratory air from the right and left lung simultaneously, and register volume, oxygen consumption and carbon dioxide production. The ventilation of the lungs is registered for five to seven minutes, and during this time the patient makes one maximum inspiration and one maximum expiration. The bronchspirometric method will prove of great value in elucidating many obscure problems in the functional physiology and pathology of the lungs. In healthy persons it has been proved that the right lung has a greater share in the total function of the lungs than has the left. Before deciding to perform a pneumothorax or a thoracoplasty on one lung it is advisable to study the functional capacity of the opposite lung.

496 Sulphur Dioxide in Epidemic Colds

A. G. RAWLINS (*Arch. Otolaryng.* Chicago, February, 1937, p. 119) with the majority of observers, accepts the following data on the causation of the common cold: (1) No definite organism has been proved responsible. (2) Visible bacteria are probably secondary invaders. (3) There is considerable evidence that colds are due to an invisible unculturable filterable agent of some kind. The period of incubation is from one to three days, and the period of immunity from three to four months. Many so-called colds are flare-ups of chronic posterior sinusitis. Such conditions did not come into the scope of the author's investigation, neither did epidemic streptococcal infections of the throat. The author's brother, a professor of plant pathology, working on filterable viruses which attack plants, found that these viruses do not behave towards ordinary antiseptics as do visible bacteria; 70 per cent alcohol and 1 in 1000 solution of mercury bichloride had little effect in destroying these viruses. However, low concentrations of sulphur dioxide (0.6 to 1.5 per cent) readily destroyed these plant viruses, and also the virus of foot and mouth disease. Rawlins conceived the idea that

sulphur dioxide might likewise destroy the filterable virus of the common cold if this antiseptic could be applied to the infected area in the early stage of the disease. This can be done easily by inhaling a concentrated solution of sulphurous acid, as this liquid gives off sulphur dioxide in large quantities. In a recent winter epidemic treatment with sulphur dioxide was tried on eighty patients who were in the first stage of what appeared to be an epidemic cold. Of these fourteen received no relief. 66 stated that they were completely cured on the first or the second day after treatment. On the third and fourth days of a cold the results were practically negative. The patient is given a three-ounce bottle half filled with a saturated solution of sulphur dioxide. He inhales the gas from the bottle for ten minutes three times during the first day. Inhalations need not be deep, only sufficient to fill the nose and mouth cavity is necessary. By closing the mouth the gas is forced into the nasopharynx. Sulphur dioxide is a harmless gas, as has been shown in chemical factories where workmen are exposed to these fumes.

497 Peritonsillar Abscess

W HENSLE (*Dtsch med Wschr*, March 19, 1937, p 489) reports his experiences in the municipal hospital of Mannheim between 1927 and 1935 with 421 cases of peritonsillar abscess. In 244 cases a bacteriological examination was made of the pus usually obtained by exploratory puncture before operation. In 207 cases haemolytic streptococci were found in pure culture, and in seven cases in association with anaerobic streptococci in three cases with staphylococci, once with *B. coli* and once with pneumococci. While the sex distribution of the patients was even it was remarkable how many of them were between 20 and 30. The abscess burst spontaneously in 119 cases, and in twenty-one cases septicaemia followed. The treatment of this complication by ligation of the internal jugular vein was followed by the patient's recovery in only five cases. This meagre success could be traced to the delay in admitting the patients to hospital after they had had several rigors and pulmonary abscesses had formed. The nineteen deaths represented a comparatively high mortality of 4.5 per cent. due to delay in admission to hospital and consequent delay in operation. Though the author discounts the risks of piercing the ascending pharyngeal artery in the course of lancing a peritonsillar abscess, he prefers to open it bluntly with Hartmann's polypus forceps. The wide opening of the forceps after its entry assures a free escape of the pus.

Obstetrics and Gynaecology

498 Vitamin C in Pregnancy

A BUCHER (*Munch med Wschr*, May 7, 1937, p 734) was able to demonstrate that there is a lack of vitamin C in the urine of pregnant women. For this demonstration he used the dichlorophenol indophenol test. The pregnant woman requires approximately 100 to 300 milligrammes of vitamin C each day. This is easily supplied by a diet rich in fresh fruit and vegetables. But in some instances it may be necessary to supplement the diet by synthetic vitamin C. In pregnant and nursing women treated in this way no dental caries has occurred, stopped teeth and the gums remained equally healthy. The administration of vitamin C had further a favourable effect on the body generally.

499 Short wave Treatment in Eclampsia

J ENIMERICH (*Zbl Gynäk*, May 15, 1937, p 1165) gives the results of the application of short-wave diathermy in a number of cases of eclampsia. He used a valve-emitter, a wave length of 6 metres and an intensity of 300 to 350 watts. He treated the kidneys, liver and head. Generally speaking relief was afforded in a number of cases but it cannot be considered to have solved the problem of

eclampsia and of the pre-eclamptic state. In a few instances the treatment resulted in an aggravation of the condition, it is probably contraindicated in patients with a tendency to convulsions, but influences favourably eclamptic coma.

Pathology

500 Coagulation of Haemophilic Blood

A J PATEK, jun. and F H TAYLOR (*J clin Invest*, January, 1937, p 113), by acidifying with 1 per cent. acetic acid, Berkefeld filtered normal citrated plasma, have isolated a globulin-like substance which promotes clot formation in haemophilic blood. Approximately 500 to 700 mg were obtained from 100 ccm of plasma. This "globulin substance" was effective both fresh and after drying in the cold *in vacuo in vitro* and when given intravenously was thermolabile as to its clot-promoting activity, insoluble in water at a pH of 6.5 but soluble in physiological saline. It passed through a Berkefeld filter, but was not ultrafilterable. The optimum pH range for its precipitation was 5.9 to 6.4. A comparable yield of a similar precipitate could be obtained from haemophilic plasma but had very little effect in hastening the clotting of haemophilic blood. The globulin substances from normal and haemophilic plasmas were equally effective in clotting a calcium fibrinogen system. The inference, therefore, is that the difference between normal and haemophilic blood is due either to a qualitative difference of the globulin or to other substances associated with the globulin fraction of the plasma.

501 Activation of Prontosil

E A BLISS and P H LONG (*Johns Hopk Hosp Bull*, February 1937, p 149) have tested *in vitro* the effect on streptococci of prontosil soluble when reduced with cysteine hydrochloride. Subcultures of two strains of β haemolytic streptococci were made in (a) broth and prontosil soluble, with cysteine hydrochloride (b) broth and prontosil soluble, (c) broth and cysteine hydrochloride (d) broth alone. Inhibition of growth occurred only in (a) in which also the colour of the prontosil solution was discharged, showing that reduction had taken place. Reduction was never immediate but increased gradually during incubation. It was quicker and more complete in broth than in serum broth, in which inhibition of growth of the streptococci was not nearly so good as in simple broth. Colourless (reduced) prontosil solution had a therapeutic activity in mice with experimental peritonitis comparable to what would be expected from a solution of para amino benzene sulphonamide of the same concentration. The authors express the belief that the bacteriostatic substance in reduced prontosil solution is para amino benzene sulphonamide produced by the reduction and splitting of the azo group of prontosil soluble.

502 Biological Assessment of Male Sex Hormone

H KUN and O PECZENIK (*Wien klin Wschr*, April 2, 1937, p 439) recall that male sex hormones have been tested either by the modification produced in the secondary sex characters of birds or by the increase in the size of the prostate and vesiculae seminales produced in castrated rats or guinea pigs. The quantitative test which they have perfected consists in the injection of the hormonal preparation to be tested, in graduated doses into castrated rats and the measurement of the minimal dose which will restore the occurrence of ejaculation following electrical stimulation of the rump by a current of 30 volts. Testosterone androstendiol and androsterone are effective in descending order. Kun and Peczenik confirm the finding that the activity of some of the male hormones is greatly increased by the simultaneous administration of the female sex hormone folliculin.

EXAMEN

ATHE LIVER EXTRACT

HIGHER POTENCY

Extract of the liver of the cod fish, which is the source of the active principle of the cod liver oil, is the most potent and purest form of the active principle of the cod liver oil.

PERMANENTLY ACTIVE PRINCIPLE

The active principle of the cod liver oil is the most potent and purest form of the active principle of the cod liver oil.

GREATER PURITY

The active principle of the cod liver oil is the most potent and purest form of the active principle of the cod liver oil.

"... I saw it in the B.M.J."

With this new preparation of the active principle of the cod liver oil, the active principle of the cod liver oil is the most potent and purest form of the active principle of the cod liver oil.

Our records show that the active principle of the cod liver oil is the most potent and purest form of the active principle of the cod liver oil.

In dealing with the active principle of the cod liver oil, the active principle of the cod liver oil is the most potent and purest form of the active principle of the cod liver oil.

ST. ANDREW'S HOSPITAL

FOR MENTAL DISORDERS

NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY

President THE MOST HON THE MARQUESS OF EXETER CMG ADC.

Medical Superintendent DANIEL F RAMBAUT M.A. MD

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary patients who are suffering from incipient mental disorders or who wish to prevent recurrence of attacks of mental trouble, temporary patients and certified patients of both sexes, are received for treatment. Careful clinical, biochemical, bacteriological and pathological examinations. Private rooms with special nurses male or female in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE

This is a Reception Hospital in detached grounds with a separate entrance to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical bath, Plombières treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray room, an Ultra Violet Apparatus, and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological and pathological research.

MOULTON PARK

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit, and vegetables are supplied to the Hospital from the farm, gardens and orchards of Moulton Park. Occupational Therapy is a feature of this branch and patients are given every facility for occupying themselves in farming, gardening, and fruit growing.

BRYN-Y-NEUADD HALL

The seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 Acres, Llanfairfechan amidst the finest scenery in North Wales. On the North-West side of the Estate, a mile of sea coast forms the boundary. Patients may visit this Branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout-fishing in the park. At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses and bowling greens. Ladies and gentlemen have their own gardens and facilities are provided for handicrafts such as carpentry, etc.

For terms and further particulars apply to the Medical Superintendent (Telephone No. 7356 and 2357 Northampton) who can be seen in London by appointment.

THE SPAS OF FRANCE

R_x
 This book is to be taken by
 every doctor and specialist
 and referred to in all cases
 where Thermal Treatment
 is specially indicated

A copy of this fully illustrated guide to the Spas of France will be gladly sent free to any medical practitioner on application. It gives the properties of all the Thermal Springs of France and is carefully classified according to diseases and complaints. A copy should be in every consulting room.

✪ For further information apply to French Railways — Notional Tourist Office 179 Piccadilly W 1, the S.R. Continental Enquiry Office Victoria Station S W 1 or the Federation of the Health Resorts of France Tavistock House Tavistock Square, London, W C 1

Choose a Spa in Czechoslovakia...

The Spas and Health Resorts of Czechoslovakia with their centuries-old tradition of healing, reinforced by the experience and researches of local specialists invite your serious consideration

In addition to places of world wide repute such as

PISTANY
(Piestany)

CARLSBAD
(Karlový Vary)

MARIENBAD
(Mariánské Lázně)

FRANZENBAD
(Františkovy Lázně)

ST JOACHIMSTHAL
(Jáchymov)

TEPLICE-SANOV
(Teplitz Schönaú)

LUHACOVICE

SLIAČ

TRENCIANSKE-TEPLICE

with their medicinal springs and mud baths there are numerous smaller spas and health resorts admirably equipped for the treatment of many diseases including those in the following groups

ANAEMIA AND CHLOROSIS
BASEDOW'S DISEASE
BRONCHIAL CATARRH
CONSTITUTIONAL DISEASES
SCROFULA RICKETS
DIGESTIVE DISEASES
DISEASES OF THE BLADDER
AND URINARY ORGANS
DISEASES OF THE KIDNEYS
DISEASES OF THE NOSE AND THROAT

DISEASES OF WOMEN
DISORDERS OF BONES
MUSCLES AND JOINTS
DISORDERS OF THE HEART
DISORDERS OF METABOLISM
AND GOUT
GALLSTONES
LEUCAEMIA
NERVOUS DISEASES AND POST
HEMIPLEGIC CONDITIONS
TUBERCULOSIS OF THE LUNGS

The arrangements in the bath establishments are up-to-date in every way, the cleanliness and neatness proverbial, the service attentive and courteous

It is accepted that a spa cure to be fully beneficial should provide a complete change of surroundings and a break with the patient's normal everyday life

The Czechoslovak Spas fulfil this purpose admirably comfortable hotels first-class orchestras and dance bands every facility for sport—tennis golf, swimming riding fishing, etc

There are also numerous fully up-to-date homes for convalescence and rest cures.

ASSOCIATE EXAMINERS

Applications will also be invited for Associate Examiners in Medicine, Obstetrics and Gynaecology, Pathology and Surgery. A separate application form must be used for Associate Examinerships and the word "Associate" must be written on it. Application Form for Forms if more than one Examinership is applied for and particulars of the remuneration and duties can be obtained from the External Registrar.

Candidates must send in their names to the External Registrar, A. Clow Ford M.B.E., B.A., with any attestation of their qualifications they may think desirable on or before Monday, July 5th, 1937. (Envelopes should be marked "Examinerships").

The Senate desire that no application of any kind be made to individual members.

If testimonials are submitted one copy only of each is required. In no case should original testimonials be submitted. If more than one Examinership is applied for a separate and complete application must be forwarded in respect of each Examinership. The appointments will be made by the Senate in November. Applicants who desire that the result should be communicated to them are requested to enclose a stamped and addressed envelope with their application.

UNIVERSITY OF LONDON KING'S COLLEGE

FACULTY OF MEDICAL SCIENCE

The Medical Faculty of this College of the University gives instruction in the subjects of Medical Science for all the usual Preliminary and Intermediate Examinations in Medicine, Surgery and Dentistry. Through its associated hospitals, students of the College have clinical facilities of over 1,000 beds.

The Medical Faculty of the College provides a general University education in touch with other Faculties, classes of which medical students are permitted to attend. There are many College societies, clubs and functions in which students of all Faculties have opportunity of meeting each other. The College has an athletic ground at Mitcham with a large and modern pavilion.

The First Year subjects are taught in the large Departments of the Faculty of Science and those for the Second and Third Years in the new Medical Department. This includes the Hablestree Department of Anatomy and an extension to the Department of Physiology recently erected at a cost of £70,000. These new buildings and those of recent years provide the College with a completely new and modern Medical Department which embodies the newest ideas in laboratory construction and equipment.

Valuable Scholarships and Prizes are awarded on the results of examinations held annually.

The hostel for men students (The Plasmas, Champion Hill, S.E.5) contains accommodation for 80 students. The hostel for women students is at 58, Queensborough Terrace, Bayswater.

For detailed prospectus of the Medical and Dental Courses and for further information apply to the Dean of the Medical Faculty or to

ST MARY'S HOSPITAL, LONDON, W 2

A Course of Lectures on **PATHOLOGICAL RESEARCH IN ITS RELATION TO MEDICINE** has been arranged for the **SUMMER SESSION**. These Lectures will be given in the Lecture Theatre of the Bacteriological Department of the Institute, on **TUESDAY AFTERNOONS** at 5 p.m. The final Lecture of the series will be the following—

JUNE 22nd

WILLIAM EWART OYE, M.D.
(Director Imperial Cancer Research Laboratories.)

Subject
Recent Work on Cancer

Syllabus supplied by the Lecturer—

During the early period of experimental cancer research—1902 to 1915—investigation waited upon the natural occurrence of tumours in animals. Since 1915 when two Japanese pathologists demonstrated that malignant new growths can be started by applying coal tar to the skin research has been largely occupied with the study of agents which possess this power of bringing about malignant transformation of normal cells—carcinogenic agents. Great progress has been made in this field of study. Chemically pure carcinogenic compounds have been prepared and many of them are related structurally to substances which occur naturally in the body. The ovarian hormone oestrone is itself carcinogenic.

Numerous experimental observations on cancer lead inevitably to the conclusion that the factors which confer upon a normal cell the property of continuous and autonomous growth reside within the cell and cannot be attributed to agents acting on the cell from without. The nature of the intrinsic cellular change which confers upon a cell the property of malignancy has been the subject of innumerable investigations by able workers in every civilised country and has been even more a subject for speculation.

The aetiology of cancer presents two entirely different aspects: first the nature of the intrinsic cellular change; secondly the conditions acting from without upon a normal cell which precede and bring about the intracellular change. The first may be called the proximate cause of cancer; the second the remote causes. Carcinogenic agents, chemical and physical are remote causes; evidence tending to show that viruses play an essential part as the proximate cause is growing. This evidence will be discussed.

These Lectures are open to all members of the Medical Profession and to all Students in Medical Schools without fee.

ST MARY'S HOSPITAL MEDICAL SCHOOL, W.2 (University of London)

THE WINTER SESSION WILL BEGIN ON OCTOBER 1st 1937

COUNTY BOROUGH OF DUDLEY

DEPUTY MEDICAL OFFICER OF HEALTH AND SCHOOL MEDICAL OFFICER

Applications are invited from duly qualified Medical men registered in the Medical Register as holders of a Diploma in Sanitary Science, Public Health or State Medicine for the above appointment.

The duties entail a full-time appointment 50 per cent. being devoted to conducting a Venereal Disease Clinic and 50 per cent. to Public Health activities. These latter include, principally Maternity and Child Welfare work and such other duties as may be requested by the Medical Officer of Health. During the absence of the Medical Officer of Health the Deputy will be the responsible head of the Department.

The salary offered is £750 per annum rising by two increments of £25 annually to £800. A deduction of 5 per cent. will be made from the salary in accordance with the Local Government and Other Officers Superannuation Act 1924 which has been adopted by the Council and the appointment will be subject to passing the Council's Medical Examination in connection therewith.

Applications, stating age and full particulars of Post Graduate experience, together with the names of three persons to whom reference can be made should be received by the undersigned not later than Saturday morning June 26th 1937.

GEO. C. V. CANT
The Council House Dudley Town Clerk.
June 4th. 1937

INDIAN MEDICAL SERVICE

RECRUITMENT OF EUROPEAN OFFICERS

Applications are invited from Medical Men for Permanent Commissions in His Majesty's Indian Medical Service. The terms offered include a gratuity of £1,000 on retirement after six years' service, or of £2,500 after 12 years' service, together with free return passages, for those who no longer desire to remain in the Service. In other respects the terms will be as detailed below.

British subjects of pure European descent who are under 32 years of age and who are registered under the Medical Acts in force in Great Britain and Northern Ireland are eligible to apply.

CAREERS

The Indian Medical Service offers a permanent career with wide opportunities of medical experience, including clinical, preventive, specialist, and research work. At the beginning of his career an officer is employed on the military side, which has medical charge of the Indian Army. Promotion is on a time scale up to the rank of Lieutenant-Colonel, and by selection to the ranks of Colonel and Major-General. An officer may apply after one year's Indian Service to have his name registered for transfer to the civil side from which appointments are made to Civil Surgeoncies, which are established at the principal civil centres to provide for the medical needs of Civil Officials and for general medical administrative purposes, to specialist (for example, public health and bacteriological) services, to research posts, and to professorships at the Medical Schools.

RATES OF PAY

24	"	1350	40	1695
25	"	1500	40	1830
	"	1500	40	1830

Note—(1) The rupee is at present stabilised at a rate equivalent to 1s 6d.
(2) An officer promoted to the rank of Lieut.-Colonel before completion of 20 years' service will receive pay at the rate of Rs. 1200 per mensem (basic) plus £40 per month overseas pay.

Extras.—In addition to the above rates various allowances are admissible for a large number of special appointments on both the military and the civil side which may be held by members of the Indian Medical Service. Special high rates of pay are also attached to the numerous administrative appointments open to officers in both branches of the Service.

ANTEDATES IN COMMISSION

Candidates possessing certain higher medical qualifications or holding the Diploma in Public Health may be granted an antedate in their commissions. Past service in certain hospital appointments may also render candidates eligible for an antedate. Persons holding or about to hold resident posts at recognised hospitals

may be seconded in those posts for a period. The maximum period of antedate, secondment, or antedate and secondment combined, admissible under this paragraph, is limited to 18 months.

OUTFIT ALLOWANCE

Officers on appointment will receive an allowance of £75 towards the cost of outfit.

PRIVATE PRACTICE

With the exception of Administrative Officers, military or civil, and officers holding certain special appointments, officers are not debarred from taking private practice, so long as it does not interfere with their proper duties.

LEAVE

Leave can be taken at reasonable intervals and adequate rates of leave pay are provided. Extra leave (known as study leave), which may not exceed 12 months in all during an officers' service, may be granted to officers desirous of pursuing special courses of study of a post-graduate nature. During such leave study allowance, at present fixed at the rate of 12s a day in the United Kingdom, £1 a day on the Continent of Europe, and £1 10s a day in the United States of America and Canada is granted to an officer in addition to ordinary rates of leave pay.

PENSIONS

The rates of pensions are as follows—

After 17 years' service for pension	Per annum
18	£372 0s
19	£400 0s
20	£428 0s
21	£465 0s
22	£502 0s
23	£539 10s
24	£576 10s
25	£614 0s
26	£651 0s
27	£697 10s
	£744 0s

There are additional pensions ranging from £65 to £350 per annum for officers who have held administrative appointments.

PASSAGES

An officer on appointment is provided with free passage to India. The families of officers who are married prior to the date of the officers' embarkation on first appointment will also be provided with free passage to India, subject to the payment of messing charges. Officers and their families are also eligible for passage concessions under which they are granted a certain number of return passages home at Government expense during their service.

INSTRUCTION PRIOR TO EMBARKATION

Officers are required to undergo courses of instruction at the Royal Army Medical College and at Aldershot, lasting approximately three months, prior to their embarkation for India on first appointment. Information as to the rates of pay admissible during this period and subsequently up to arrival in India is contained in the memorandum referred to below.

A memorandum giving full details regarding these appointments and forms of application may be obtained from the UNDER SECRETARY OF STATE FOR INDIA, MILITARY DEPARTMENT, INDIA OFFICE, LONDON, S.W.1. The Selection Committee will meet at the India Office in July next, and the selected candidates will be required to join a course of instruction commencing on September 1st, prior to sailing for India about December 1937. Applications should be submitted as soon as possible.

ROYAL AIR FORCE MEDICAL SERVICE

Applications are invited from medical men for appointment to commissions in the Medical Branch of the Royal Air Force for entry in September, 1937

Candidates must be of pure European descent. They must be British Subjects, the sons of British Subjects and registered under the Medical Acts

Candidates must be under 28 years of age and will be selected after interview by a selection board without competitive examination

Hospital appointments held since qualifying will, under certain conditions, qualify candidates for antedate of commission up to a maximum of one year, the age of entry may, if necessary, be increased by a period equal to the "antedate"

Selected candidates will be appointed to short service commissions (for 3 years extendible to 5 years) followed by 4 years' service in the Reserve, and will be eligible to be considered for Permanent Commissions during their second or third year of service. Officers not selected for permanent commissions receive gratuity as follows, on transferring to the Reserve —

On completion of 3 years—£400

On completion of 5 years—£1,000

Copies of the regulations for entry and conditions of service, including rates of pay and allowances, also form of application, may be obtained on application from —

The Secretary,
Air Ministry (DMS),
Adastral House,
Kingsway, W C 2

Completed applications from intending candidates for the vacancies in September, 1937, must be received in the Air Ministry not later than the 15th of July, 1937

ROYAL NAVAL MEDICAL SERVICE.

Vacancies exist for Medical Officers in the Royal Navy, and applications are invited for entry in October, 1937

Candidates below the age of 28 years are preferred, and they must be registered under the Medical Acts. No examination in professional subjects will be held, but candidates will be required to attend for interview by a Selection Board

Selected candidates will be entered for Service for a period of three years in the first instance, which may be extended to five years at the discretion of the Admiralty

At the end of three years' service officers may retire with a gratuity of £400, but those who serve for five years will receive £1,000

At the end of five years' Short Service permanent commissions will be given to selected officers who wish to make the Naval Medical Service their permanent career. Officers transferred to the permanent list will receive a gratuity of £1,000 (less Income Tax)

Opportunities are available for officers on the permanent list to specialise, and ample provision is made for Post Graduate study

Copies of the regulations for entry and conditions of service, including rates of pay and allowances, may be obtained from the Medical Director-General of the Navy, Admiralty, S W 1, and from the Deans of all Medical Schools

Applications for entry from intending candidates must be received not later than August 31st, 1937

COUNTY COUNCIL OF MIDDLESEX

NORTH MIDDLESEX COUNTY HOSPITAL, EDMONTON

JUNIOR RESIDENT ASSISTANT MEDICAL OFFICER

Applications are invited for the above appointment. Salary £250 per annum with board lodging and laundry. Candidates must be registered Medical Practitioners, who have held resident appointments in a general hospital.

The appointment, which will be subject to medical examination, is for a period of six months with the option of renewal for a further period of six months if desired and on the recommendation of the Medical Superintendent, and is subject to one month's notice on either side. At the expiration of one year's service, the successful candidate if considered satisfactory in all respects will be eligible, upon recommendation of the Medical Superintendent and subject to confirmation by the Council for promotion to the post of Assistant Medical Officer. If not so appointed he will leave the Council's service.

The officer appointed will work under the direction of the Medical Superintendent and will devote his whole time to his official duties.

ANAHÆMIN B.D.H.

The anti-anæmic principle of liver

The administration of anahæmin in the treatment of pernicious anaemia results in a remarkable increase in the percentage of reticulocytes within a few hours of the first injection, this reticulocyte response attains a maximum usually in five to six days, simultaneously, there is an appreciable rise in the red blood count which, in the majority of cases, continues rapidly after each injection reaching normal five to six weeks after the beginning of the treatment.

A further satisfactory feature of anahæmin treatment is the effect which is apparent on subjective symptoms, for example, there is a return to the feeling of well-being and an increase in appetite, soreness of the tongue ceases, epigastric discomfort, vomiting and diarrhoea usually clear up within the first ten days, whilst paresthesia disappears in about two weeks.

The cost of Anahæmin B D H therapy is exceptionally low, for example, even in a case requiring as much as 5 injections of 2 c c at intervals extending over a period of six to eight weeks the cost is less than 25s, subsequent maintenance treatment by the injection of 2 c c per month costs approximately 5s per injection.

Mr. THERM (of Harley St) says:

**'A Gas fire changes
the air in a room 3 or 4
times every hour'**

A warm room *can* be stuffy—but not when it is warmed by a gas fire. For a modern gas fire continuously ventilates the room—not so fiercely that it makes a draught, but steadily enough to clear the stale air completely away every 20 minutes or so. That is one of the reasons why gas fires make a house not only comfortable but healthy to live in. Another reason is that a modern gas fire emits a larger proportion of the shorter infra-red rays which are known to be beneficial because their warmth is penetrating.

WHEN SECONDS COUNT

*—your gloves must be literally a part
of your hands They must respond to
every delicate operative movement . .*

That's why more and more surgeons are insisting on *Maderite* Surgeons' Gloves. They have experienced the skin freedom of these gloves, the firm grip. Slip on a pair, wet them and see for yourself the firmness with which you can grip slippery objects. Observe their uniform tissue thinness, anatomical fit, their doubly reinforced wristbands.

Though thin and uniform, special processing has made them tough—for protection, longer life, and economy. *Maderite* Surgeons' Gloves return from the autoclave time after time, alive and elastic. Made by the manufacturers of the famous Seamless Standard Latex Surgeons' Gloves—the finest money can buy.

We Suggest that You Recommend THE ORIGINAL PINEAPPLE JUICE FROM HAWAII

THIS appetising fruit juice from Hawaii offers a sparkling change from routine fruit juice menus. Children especially like it. Because it is assimilated so easily it is ideal for babies. That is why when your patients ask your advice about fruit juices we suggest that you recommend Dole—the original Hawaiian pineapple juice. This delicious golden juice is sealed in tins by the exclusive Dole Fast-Seal Vacuum Packing Process. That is why Dole Pineapple Juice retains, in high degree the fresh fruit constituents of ripe pineapple as well as the fragrant, field fresh flavour. Also it is a natural source of vitamins A, B & C. J. K. Husband & Co., Ltd., 10 Eastcheap, London, E.C.3

Here is a typical Analysis of Dole Pineapple Juice

Moisture	85.3%
Ash	0.4
Fat (ether extract)	0.3
Protein (N x 6.25)	0.3
Crude fibre	0.02
Titrateable acidity as citric acid	0.9
Reducing sugars as invert sugar	12.4
Carbohydrates other than sugars (by difference)	0.38

THE SURF RIDER—Surfing the sport of Hawaiian kings in olden days, was one of the favourite pastimes. Owing to the way the surf breaks on the reef Waikiki is the only place in the world where this sport is indulged in under ideal conditions. It is a marvellous sight to see the upright gleaming brown bodies of the native surfers come riding swiftly shoreward on a giant comb.

P.S. Just write to us on your letterhead and we will be pleased to send you free a sample tin of delicious Dole Hawaiian Pineapple Juice.

SERENIUM

... a non-irritating antiseptic dye for use in genito-urinary infections

SERENIUM is bacteriostatic to urinary pyogenic organisms. Its antiseptic action combats the infective processes and helps the physician to maintain suitable local treatment. It lessens the irritation and promotes the comfort of the patient.

SERENIUM is a distinct chemical compound—an azo dye of high purity and uniformity especially prepared for the oral treatment of genito-urinary infections. It is non-irritating, free from toxic effects and active in acid or alkaline urine.

SERENIUM is distributed in bottles of 25, 50 and 500 chocolate coated tablets of 0.1 Gm. each.

ALASIL

Better Salicylate Therapy

WHATEVER be the season of the year there is a wide sphere of utility for Alasil the improved form of salicylate medication

Alasil™ is a very definite advance on ordinary compounds of salicylic or acetyl salicylic acid both in therapeutic efficiency and in freedom from the risk of unpleasant gastro-intestinal sequelae. This high tolerability is due to the fact that Alasil is composed of calcium acetyl salicylate—the least irritating of the salicylate compounds—and “Alocol” (Colloidal Hydroxide of Aluminium) a powerful gastric sedative and antacid.

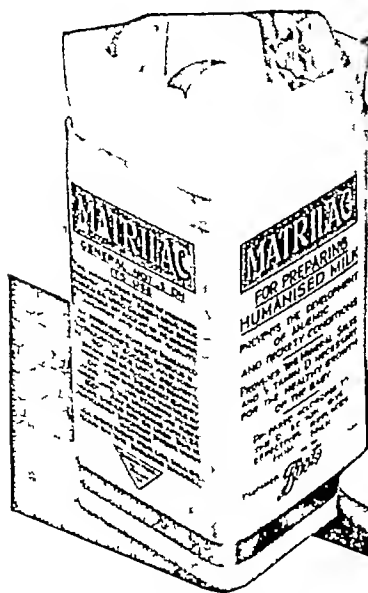

A careful series of experimental tests has shown that Alasil™ is more completely absorbed than ordinary salicylate compounds and that it is practically free from the risk of liberating free salicylic acid in the stomach.

Wide clinical experience anticipated these findings by demonstrating that Alasil™ can be pushed or prolonged to a much greater extent than ordinary salicylate compounds and that it can be given with safety to children adults, the aged and patients with finely balanced digestive capacities. An analgesic antipyretic and sedative of established value.

'DETTOL' and Midwifery.

The composition and properties of 'Dettol' make it a most suitable antiseptic for use in the conduct of labour. Its properties enable it to be used in really effective strengths on the skin and mucous membranes. It has been shown that when half a teaspoonful of 30% 'Dettol' is rubbed into the hands, allowed to dry and kept free from gross contamination, the skin remains insusceptible to infection by haemolytic streptococci for at least two hours.

'Dettol' has high germicidal efficiency and this is well maintained in the presence of blood, serum, pus and other organic matter. 'Dettol' is obtainable from chemists in 1/- and 3/- bottles and in larger sizes for medical and hospital use. These prices do not apply in the Irish Free State and Overseas. Samples and full information on request.

RADIOSTOLEUM

(Standardised Vitamins A and D)

A valuable prophylactic in pregnancy

The administration of Radiostoleum is indicated during the last few months of pregnancy in order to build up the mother's resistance against infection at the birth and furthermore, to counteract a deficiency of the calcifying Vitamin D

Moreover, the administration of Radiostoleum ensures an abundance of the two vitamins, A and D, to meet the needs of the growing foetus, a shortage during that particular period of development being liable to produce irreparable defects in after-life

When iron is indicated prescribe

IDOZAN

BRAND

5% of Fe Colloidal Iron
Solution

8, 40 & 80 oz Bottles

IDOZAN meets the fundamental requirements of an effective iron therapy. It establishes a strong positive iron balance. It is easily absorbed from the intestinal canal providing a ready and abundant storing of surplus iron. IDOZAN is non constipating, non irritating and does not discolour the teeth.

In general clinical practice

Acridlavine meets the need of the physician in practice in a wide variety of conditions encountered daily, and many clinical reports testify to its outstanding value

' I used ACRIFLAVINE 'B D' as a routine in the treatment of varicose ulcers a strip of gauze soaked in a solution of ACRIFLAVINE 'B D' (0.1%) wrapped round the leg and a crepe bandage is applied over this dressing, which is changed once a week '

' I have used ACRIFLAVINE 'B D' actually as eyedrops, in a 1% solution and there is nothing to touch it '

' In the treatment of inflammation of the bladder I have met with striking results following the use of a solution of ACRIFLAVINE 'B D' (0.1%) for washing the bladder, together with an injection (intravenous), also, of ACRIFLAVINE 'B D' '

ACRIFLAVINE 'B.D.'

ARGYROL—relief for Hay Fever

BRAND SILVER VITELLIN

With the advent of summer and the prevalence of hay fever caused by the pollen of grasses, any measure of relief from the distressing symptoms is welcomed by the sufferer.

"Relief often follows the use of pledgets of cotton saturated with 10 per cent. Argyrol placed in the vault of the nose and allowed to remain from 15 minutes to one half hour. The method is a very useful addition to any other form of treatment" ('A Manual of Diseases of the Nose, Throat and Ear,' by E. B. Gleason, M.D., LL.D., Professor of Otology, Medico-Chirurgical College Graduate School of Medicine, University of Pennsylvania).

The pre-eminence of Argyrol Brand Silver Vitellin in the treatment of mucous membrane irritation and inflammation is due to the fact that it is a unique compound.

The very great differences between Argyrol and other silver salts in silver ion and in hydrogen ion concentration (or alkalinity) no doubt have much to do with the irritation noted by doctors

When allegedly equivalent mild silver proteins are substituted. The pH and pAg of Argyrol are especially regulated for treatment of delicate mucous membranes. Thus, the original mild silver salt, has never been duplicated outside the Barnes Laboratories. **INSURE YOUR RESULTS, SPECIFY "ARGYROL"**

FORMULA

Thyminic Acid	0.10
Hexamethylenetetramine	0.10
Anhydromethylenecetrane	0.10
Hexamethylene Tetramine	0.25
Lysine Tartrate	0.25
Lithium Carbonate	1.00
Sodium Benzoate	1.00
Lifescient Base	nd 100

DIRECTIONS

One teaspoonful to be taken morning and night in a tumblerful of water

Uralysol, In addition to being a solvent and eliminator of pathological Uric Acid is a powerful urinary antiseptic.

Normally there exists in the body a certain quantity of uric acid which assists general metabolism and after it has played its part is eliminated together with the normal thyminic acid of the organism. When however uric acid is present in excess the body needs additional thyminic acid to supplement the resultant deficit of this normal solvent of uric acid.

Uralysol, by its thyminic acid content, supplies the agent necessary to dissolve excessive uric acid.

The next step is the elimination of this thyminic uric acid which being in excess of normal necessitates treatment by an agent capable of enhancing elimination.

Uralysol, by its content of hexamethylenetetramine and lysidin, stimulates the organism to eliminate the pathological uric acid already dissolved by its thyminic acid content.

MARMITE

(YEAST EXTRACT)

For vitamin B₁ and
vitamin B₂ complex

The value of supplementing restricted diets with Marmite for its high vitamin content is becoming increasingly appreciated. It is considered particularly beneficial in diabetes and colitis. An authority outlining the dietetic treatment of gastro-duodenal haemorrhage states —

Marmite is given at least once a day for the vitamin B complex (*Brit Med Journ April 24th 1937 p. 847*)

As a therapeutic agent in disorders associated with deficiency of vitamin B₁ or the B₂ complex Marmite is prescribed extensively. In a recently published paper referring to pellagrous conditions case reports are quoted which illustrate

the dramatic effect of Marmite on the skin lesions (*Lancet May 22nd 1937 p. 1225*)

Marmite is also ordered for its specific haemopoietic properties in the treatment of certain forms of anaemia.

THE 'BETWEEN-MEAL SNACK' **—ITS EFFECT ON WORKING EFFICIENCY**

*How Cadburys Milk Chocolate provides
nourishment in a convenient form*

THE conventional spacing of meals — 3 per day with a considerable gap in between them — has by recent research been shown not to give the uniform energy output which is desirable. In many normal people working efficiency drops considerably before their next meal is due. In such cases a small between-meal snack will be found most beneficial. The merits of milk in this connection are well known, but conditions of work are not usually favourable to anything save the most compact and portable form of nourishment. It is here that the advantages of Cadburys Milk Chocolate become apparent — supplying as it does all the goodness of milk in a concentrated and convenient form.

That in conversion the nutriment and food values of the milk are not modified or decreased is demonstrated by a vitamin assay of Cadburys Milk Chocolate made by the highest independent authority. The chocolate was found to contain 6 International Units of Vitamin A per gram as compared with a stated potency for milk of 3 International Units per gram.

***1½ glasses of full-cream milk contained
in every ½ lb. block***

IMPORTANT ANNOUNCEMENT

For the convenience of doctor and patient alike, the weight of

'PRONTOSIL' ALBUM Tablets
gr. 5* is now increased to gr. $7\frac{1}{2}$ per
tablet at a price lower than that of the
original tablets (*see below*).

ALSO

'PRONTOSIL' SOLUBLE ($2\frac{1}{2}\%$ solution)
has been increased in strength to 5%,
thereby reducing the amount of fluid to
be injected by half.

Again, the price is fixed below the cost of
the original solution (*see below*).

* No. 100-1111111111

These substantial reductions in the prices of 'Prontosil' have been made possible by rationalised production and increased demand for the preparations in all countries

REVISED PRICE LIST

PRONTOSIL ALBUM TABLETS (gr. $7\frac{1}{2}$ - 0.5 gm)	PRONTOSIL SOLUBLE (5% Solution)

Vitamin Concentrate or Natural Food?

The normal daily dosage of Bemax, i.e., $\frac{1}{2}$ -ounce, provides 200 International units of Vitamin B₁, which is from four to ten times as much as the recommended daily dosage of certain Vitamin B₁ "concentrates" advertised to the medical profession. If a higher intake is

required, it is possible to supply as much as 600 to 800 units of Vitamin B₁ daily by the administration of three to four tablespoonfuls of Bemax, and this in an entirely natural form at only a fraction of the cost of concentrates

The Vitamin B₁ potency of Bemax is assured by biological assay of every day's output

BEMAX

A unique natural source of accessory nutritional factors for the high-vitamin diet

Vitamin B₁—400 International Units per ounce
Vitamin B₂—Flavine present B₂—Rich supply
Vitamin A—280 International Units (as Carotene)

Vitamin E—the richest natural source,
Phosphorus—330 mg per ounce,
Magnesium—99 mg per ounce,
Iron—3 mg per ounce, and Copper—0.45 mg per ounce

Sterility and Habitual Abortion

The increasing use of Vitamin E for habitual abortion and sterility of dietary origin demands a wheat germ oil of proven high activity and of stable Vitamin value. Such an oil is available for the medical profession in Fertiloil.

FERTILOIL

A highly active source of Vitamin E

Literature on request

The Bemax Laboratories (Dept B40), Upper Mall, London, W 6

Her trouble was in vain
 HIS DOCTOR DID NOT KNOW OF

Lulizym

Disturbances of the Digestive Processes and their distressing consequences, such as raised diaphragm with palpitation of the heart and shortness of breath, symptoms of fermentative dyspepsia, indigestion of albumin (albumin dyspepsia, putrefactive catarrh), etc., after eating heavy or distending foods, are prevented and removed

All kinds of therapeutic remedies were tried without the slightest effect. Elimination of all farinaceous food from the diet had only temporary effect.

After the first tablets of Lulizym my trouble disappeared as though by magic. If I stop taking them the trouble recurs but am able already to reduce the dose. I am publishing this account of my own experience—that is to say, experience on my own body—not only because in my case Lulizym literally proved my salvation but because once to my private several colleagues have been recommended with the most successful results.

Dr. E. J. Lee, Vienna, 177
 177, 178, 179, 180, 181, 182, 183, 184, 185, 186, 187, 188, 189, 190, 191, 192, 193, 194, 195, 196, 197, 198, 199, 200, 201, 202, 203, 204, 205, 206, 207, 208, 209, 210, 211, 212, 213, 214, 215, 216, 217, 218, 219, 220, 221, 222, 223, 224, 225, 226, 227, 228, 229, 230, 231, 232, 233, 234, 235, 236, 237, 238, 239, 240, 241, 242, 243, 244, 245, 246, 247, 248, 249, 250, 251, 252, 253, 254, 255, 256, 257, 258, 259, 260, 261, 262, 263, 264, 265, 266, 267, 268, 269, 270, 271, 272, 273, 274, 275, 276, 277, 278, 279, 280, 281, 282, 283, 284, 285, 286, 287, 288, 289, 290, 291, 292, 293, 294, 295, 296, 297, 298, 299, 300, 301, 302, 303, 304, 305, 306, 307, 308, 309, 310, 311, 312, 313, 314, 315, 316, 317, 318, 319, 320, 321, 322, 323, 324, 325, 326, 327, 328, 329, 330, 331, 332, 333, 334, 335, 336, 337, 338, 339, 340, 341, 342, 343, 344, 345, 346, 347, 348, 349, 350, 351, 352, 353, 354, 355, 356, 357, 358, 359, 360, 361, 362, 363, 364, 365, 366, 367, 368, 369, 370, 371, 372, 373, 374, 375, 376, 377, 378, 379, 380, 381, 382, 383, 384, 385, 386, 387, 388, 389, 390, 391, 392, 393, 394, 395, 396, 397, 398, 399, 400, 401, 402, 403, 404, 405, 406, 407, 408, 409, 410, 411, 412, 413, 414, 415, 416, 417, 418, 419, 420, 421, 422, 423, 424, 425, 426, 427, 428, 429, 430, 431, 432, 433, 434, 435, 436, 437, 438, 439, 440, 441, 442, 443, 444, 445, 446, 447, 448, 449, 450, 451, 452, 453, 454, 455, 456, 457, 458, 459, 460, 461, 462, 463, 464, 465, 466, 467, 468, 469, 470, 471, 472, 473, 474, 475, 476, 477, 478, 479, 480, 481, 482, 483, 484, 485, 486, 487, 488, 489, 490, 491, 492, 493, 494, 495, 496, 497, 498, 499, 500, 501, 502, 503, 504, 505, 506, 507, 508, 509, 510, 511, 512, 513, 514, 515, 516, 517, 518, 519, 520, 521, 522, 523, 524, 525, 526, 527, 528, 529, 530, 531, 532, 533, 534, 535, 536, 537, 538, 539, 540, 541, 542, 543, 544, 545, 546, 547, 548, 549, 550, 551, 552, 553, 554, 555, 556, 557, 558, 559, 560, 561, 562, 563, 564, 565, 566, 567, 568, 569, 570, 571, 572, 573, 574, 575, 576, 577, 578, 579, 580, 581, 582, 583, 584, 585, 586, 587, 588, 589, 590, 591, 592, 593, 594, 595, 596, 597, 598, 599, 600, 601, 602, 603, 604, 605, 606, 607, 608, 609, 610, 611, 612, 613, 614, 615, 616, 617, 618, 619, 620, 621, 622, 623, 624, 625, 626, 627, 628, 629, 630, 631, 632, 633, 634, 635, 636, 637, 638, 639, 640, 641, 642, 643, 644, 645, 646, 647, 648, 649, 650, 651, 652, 653, 654, 655, 656, 657, 658, 659, 660, 661, 662, 663, 664, 665, 666, 667, 668, 669, 670, 671, 672, 673, 674, 675, 676, 677, 678, 679, 680, 681, 682, 683, 684, 685, 686, 687, 688, 689, 690, 691, 692, 693, 694, 695, 696, 697, 698, 699, 700, 701, 702, 703, 704, 705, 706, 707, 708, 709, 710, 711, 712, 713, 714, 715, 716, 717, 718, 719, 720, 721, 722, 723, 724, 725, 726, 727, 728, 729, 730, 731, 732, 733, 734, 735, 736, 737, 738, 739, 740, 741, 742, 743, 744, 745, 746, 747, 748, 749, 750, 751, 752, 753, 754, 755, 756, 757, 758, 759, 760, 761, 762, 763, 764, 765, 766, 767, 768, 769, 770, 771, 772, 773, 774, 775, 776, 777, 778, 779, 780, 781, 782, 783, 784, 785, 786, 787, 788, 789, 790, 791, 792, 793, 794, 795, 796, 797, 798, 799, 800, 801, 802, 803, 804, 805, 806, 807, 808, 809, 810, 811, 812, 813, 814, 815, 816, 817, 818, 819, 820, 821, 822, 823, 824, 825, 826, 827, 828, 829, 830, 831, 832, 833, 834, 835, 836, 837, 838, 839, 840, 841, 842, 843, 844, 845, 846, 847, 848, 849, 850, 851, 852, 853, 854, 855, 856, 857, 858, 859, 860, 861, 862, 863, 864, 865, 866, 867, 868, 869, 870, 871, 872, 873, 874, 875, 876, 877, 878, 879, 880, 881, 882, 883, 884, 885, 886, 887, 888, 889, 890, 891, 892, 893, 894, 895, 896, 897, 898, 899, 900, 901, 902, 903, 904, 905, 906, 907, 908, 909, 910, 911, 912, 913, 914, 915, 916, 917, 918, 919, 920, 921, 922, 923, 924, 925, 926, 927, 928, 929, 930, 931, 932, 933, 934, 935, 936, 937, 938, 939, 940, 941, 942, 943, 944, 945, 946, 947, 948, 949, 950, 951, 952, 953, 954, 955, 956, 957, 958, 959, 960, 961, 962, 963, 964, 965, 966, 967, 968, 969, 970, 971, 972, 973, 974, 975, 976, 977, 978, 979, 980, 981, 982, 983, 984, 985, 986, 987, 988, 989, 990, 991, 992, 993, 994, 995, 996, 997, 998, 999, 1000

The original digestive enzyme preparation containing cellulase and hemicellulases (in addition to ferments which decompose starch, albumin, and fatty substances) for the digestion of vegetable food without the production of gas

LUIZYM increases tolerance to and assimilation of food of every kind. Bottles of 20, 50, and 200 tablets.

Most patients hate rigorous diet prescriptions

Cystopurin

The ideal urinary antiseptic for oral administration!

- | | |
|---|--|
| 1 Produces no gastric irritation or toxic symptoms | 5 Acts from the renal pelvis downwards |
| 2 Is readily absorbed from the gut and excreted in the urine | 6 Is active in either acid or alkaline urine |
| 3 Causes no renal irritation | 7 Perfectly safe for use in febrile conditions. |
| 4 Renders the urine bactericidal in low concentrations | 8 Acts on all causative organisms of urinary infections |

GNORRHOEA

From information received —

I have had two cases of acute (anterior) gonorrhoea on Cystopurin for the past four or five weeks, and have been highly pleased with their progress. There was no local treatment and the disease remained localised anteriorly with absence of any complication—the discharge cleared within two weeks in each case. The urine is now quite clear. In both cases a centrifugalised specimen shows no gonococci, though in one case there are a few pus cells. In each case I used eight tablets daily.

Husband, aged 40 and wife, aged 36 suffering from gonorrhoea, were treated in addition to vaccines and irrigation with Cystopurin orally. The frequency was relieved and also the burning on micturition. Husband developed acute orchitis which cleared up in one week. Total duration of complaint in both cases seven weeks.

I consider Cystopurin an excellent remedy in all cases of urinary diseases and especially in gonorrhoea, and I often prescribe it to my patients with excellent result."

"I have used Cystopurin tablets in a case of gonorrhoea untreated for 10 days discharge resistant to irrigation of Pot Permang. Result—completely clear after three days on Cystopurin."

Cystopurin has been given to a male patient aged 27 years, suffering from a recurrence of old gonorrhoeal urethritis with itching of meatus, slight scalding and morning drop. Urine very alkaline and containing pus. This case was made worse by usual acid urinary antiseptics, but after administering two Cystopurin tablets every four hours for two days, the symptoms cleared up.

I had occasion to use Cystopurin in a case of acute gonorrhoea and with almost immediate relief to the patient. It now appears to me to be a *sine qua non* as far as the future treatment of gonorrhoea is concerned.

"I used Cystopurin with great success in gonorrhoea."

Supplied in bulk and in tubes of 20 tablets for dispensing purposes.

Samples and literature available on request to

GENATOSAN LIMITED, Loughborough, Leicestershire

FOR THE TREATMENT OF PERNICIOUS ANAEMIA

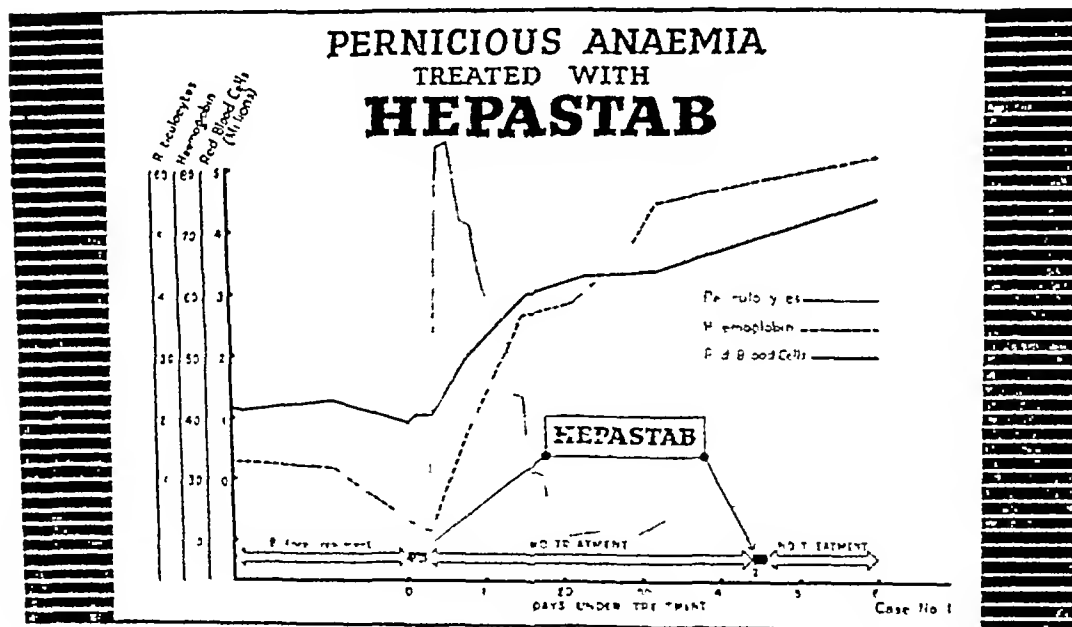

TRADE MARK

HEPASTAB

BRAND

Intramuscular Liver Extract.

It is universally agreed that parenteral treatment of pernicious anaemia is very efficient and cheap and enables definite therapy to be given to the patient whatever the clinical condition. This is the only satisfactory method of treatment when the anaemia is associated with impairment of gastro intestinal absorption. The responses are dramatic and the subsequent maintenance doses are such that only occasional small injections need be given at intervals of two to six weeks. —(Pract 1936 137 453)

Every batch of Hepastab is subjected to clinical trial under rigidly controlled conditions. Supplied in 2 c.c. and 4 c.c. ampoules.

Copies of our booklet entitled *Hepastab in the Treatment of Pernicious Anaemia* will be sent on request.

A British made 'NORGINE' Product

"VIBEX"

Vitamin B₁ Solution for Parenteral Use

A standardized solution of vitamin B₁ suitable for parenteral administration is now available under the name "VIBEX". This is prepared from selected wheat germ by a special process of digestion and extraction under properly-controlled conditions of temperature and by the use of suitable solvents and reagents, so that the vitamin B₁ is presented in a solution practically free from proteins, without lipoids, and containing only a small trace of cereal sugars. The potency of the solution is controlled by assay on young albino rats and on pigeons.

The outstanding indication for the parenteral administration of "VIBEX" is in severe cases of vitamin B₁ deficiency, where hypodermic administration would be essential for stimulating the appetite and improving body-tone. It is also indicated for the treatment of diseases manifesting evidence of degeneration of the peripheral nerves. Such cases include chronic progressive polyneuritis, alcoholic neuritis and sub-acute combined degeneration of the cord.

"VIBEX" is available in boxes of six ampoules, and further details will be furnished on request.

Tetanus Antitoxin

Clinical and experimental observations have proved the value of tetanus antitoxin when used prophylactically. A dose of 3,000 to 6,000 International units should, therefore, be administered in all cases where there is a possibility of infection with *B. tetani*. If an operation is considered necessary the antitoxin should be given 3 to 5 hours before any attempt is made to clean the wound.

If any manifestations of tetanus are observed energetic specific treatment should be commenced immediately. A dose of 30,000 or 40,000 International units should be injected intrathecally, and the same or an even greater amount should be given intramuscularly. Further doses depend upon the patient's condition, and when this improves the amount of antitoxin administered may be gradually diminished.

SOME COMMON DISEASES OF THE RECTUM AND ANAL CANAL*

BY

A. LAWRENCE, ABFL, M.S. Lond., F.R.C.S.

Surgeon to the Gordon Hospital for Rectal Diseases, the Princess Beatrice Hospital, and the Woolwich Memorial Hospital; Senior Assistant Surgeon, Royal Cancer Hospital

The rectum is the terminal portion of the large intestine and its opening and closing are guarded by a special sense organ which is peculiar to man. Examination of the anal canal shows a change from the normal skin of the exterior—which extends upwards for about half an inch—into a more shiny, smooth area terminating about an inch from the surface in a series of small papillae which together make a wavy or dentate line. These papillae consist chiefly of nerve fibres and ganglion cells and are the nerve endings of the cerebrospinal nerves which supply this portion of the anal canal. The whole of this area is therefore very sensitive to pain and any irritation or inflammation leads not only to painful impulses but also to the irregular functioning of the subjacent sphincters. This region of the anal canal is called the pecten because the appearance created by the papillae and intervening Morgagnian sinuses resembles the teeth of a comb. Above this level the rectum is lined by columnar epithelium beneath which lies a large plexus of veins—the superior haemorrhoidal plexus. Enlargements of these veins with their accompanying arteries form internal haemorrhoids. This area of the anal canal together with the rest of the bowel is supplied by autonomic nerves which do not carry ordinary pain impulses. Beneath the skin of the anal orifice lies another extensive network of veins—the superficial haemorrhoidal plexus which less frequently becomes the seat of varicosities known as a vein, however, is common and causes a painful subcutaneous internal tumour.

Beside the papillae small pockets or crypts named after Morison form little sacs in which bacteria or small foreign bodies may lodge. Irritation of these or of the mouths of the sebaceous glands which open into them may give rise to tenositis or neuritis of the rectum and set up a disturbance of reflexes which call the patient's attention to his rectum and lead to a protracted function of the organ. It is a mistake to think of diseases which are peculiar to the rectum as occurring while diseases peculiar to the rest of the large intestine are absent.

of the bowel falls towards the examining finger and does not tend to drop away from the latter as is the case in the more usual left lateral or Sims's position. This leads to a more easy digital examination of a very important segment of the large intestine not necessarily through the lumen of the rectum but certainly through its wall. In addition the superior haemorrhoidal veins which drain the blood away from the pile-bearing area tend to be more compressed as they cross the brim of the pelvis and enlargements of the internal haemorrhoidal plexus are readily palpable in the right lateral position whereas they may be quite impalpable in the left lateral position.

If the examining finger is only passed into and out of the rectum little can be learned. The well lubricated finger should be inserted slowly into the anal canal and then rotated until the whole circumference has been carefully felt with the pad of the finger.

Digital examination should always be followed by inspection. The author's proctoscope† which carries its illumination in the handle has a fenestrum which occupies one third of the circumference of the distal third of the instrument and allows a clear view of one quarter of the anal canal at each insertion while at the same time the remaining three quarters are kept free from the field under inspection. For the inspection of the rectum beyond the anal canal a longer proctoscope or sigmoidoscope should be employed preferably after careful cleansing of the lower bowel with lavage. When pus or blood stained discharge is present in the rectum a specimen of this should always be removed for microscopic and bacteriological examination.

X-ray examination of the rectum is of very little value or of any value and is often poorly made. Cases of inoperable growth in the ampulla of the rectum are frequently seen in which a negative x-ray examination has been carried out some months before. For a suspected tumour a double barium enema of the rectum with the same fluid as a contrast medium should be employed.

round-cell infiltration in the neighbourhood of the pecten and the deposition of fibrous tissue. This pathological deposition of fibrous tissue which is also commonly found in other parts of the alimentary canal wherever sphincteric action occurs (especially when under the control of the will) was first described in the anal region by Mr Ernest Miles and named by him the pecten band, because, in established cases of internal haemorrhoids or in patients who have had a greater or lesser degree of anal spasm this band of fibrous tissue is formed immediately beneath the mucous membrane of the region described above as the pecten. Its presence leads to a malnutrition of the mucosa in this region and depending on its severity, to a degree of dysfunction in the act of defaecation, an increased straining, and further enlargement of the varicosities.

Fissure

The main force of the faecal mass during evacuation of the bowel is exerted on the midline of the anal canal posteriorly, and if, as a result of fibrous tissue lying beneath the mucosa in this position free movement of the mucosa on the underlying tissue is prevented then the mucous membrane becomes split and torn. Thus tearing down of one of the anal papillae occurs—in 99 per cent of cases in the midline posteriorly—and a small oedematous blob of mucous membrane may be seen at the lower end of the crack. Severe pain coming on immediately the bowels have moved, and lasting sometimes for many hours, is the common symptom. By carefully drawing the anal orifice open the lower end of the crack can be seen, together with the small tag of mucous membrane erroneously called for many years *sentinel pile*. As time goes on the edges of this crack assume the appearance of a chronic ulcer, in the base of which the fibres of the tissue forming the pecten band can often be seen. In its early stages fibrous tissue can be caused to be reabsorbed by the application of mercury. The most efficacious ointment for this purpose is one part of unguentum hydrarg. subchlor., *B.P.* combined with three parts of vaseline. This alone will often effect a cure provided the bowels are attended to and any piles which have caused the pecten band are dealt with. Combined with this ointment an analgesic should also be employed in order to relieve the patient's chief symptom and to allay spasm. Either percainal or nestosyl may be used in addition to or in combination with the mercury ointment. In more chronic cases incision of the fissure together with the fibres of the underlying pecten band will be found to be necessary. With much induration the edges of the fissure may have to be excised. Concomitant spasm of the anal sphincters may be alleviated by the intrasphincteric injection of 10 ccm of B.A.B.A., with 1 per cent percaine. Uncomplicated cases may often be treated as ambulatory patients. If large internal haemorrhoids accompany the condition then the patient should be put to bed and the whole condition radically dealt with by operation.

Piles

External—The plexus of veins lying immediately around the anal orifice seldom form external haemorrhoids by themselves. One or two small veins however frequently rupture especially in young muscular men and then form a small haematoma beneath the skin, which presents itself as a painful purple swelling immediately at the anal margin. For many years this has been known as a ruptured or thrombosed external pile. This description is quite incorrect as the condition is really a haematoma *an*. Patients are often seen in whom much discomfort has been caused by frequent attempts to push the haematoma

upwards into the anal canal, under the erroneous impression that the condition is a pile arising from within. All that is required is a small injection of a local anaesthetic, a radial incision, and a pressing out of the clot. The pain is relieved immediately by the operation, and careful cleansing for a few days, together with the application of an astringent antiseptic and analgesic ointment, as detailed above, effects a complete cure.

Internal—Internal piles are produced by dilatation of the branches of the superior haemorrhoidal artery and their accompanying venae comites. They occupy constant positions in their relation to the circumference of the anal canal, and correspond to the branches of the superior haemorrhoidal artery. Of these two occur on the right and one on the left, in the positions which may be described respectively as the right anterior, right posterior and left lateral quadrants of the anal canal. These, together with their accompanying veins, form the three primary piles which if present, may be found in these constant positions. Smaller branches, from the right posterior and left lateral vessels which seldom become enlarged before the age of 40, form secondary piles. From the right posterior vessels a pile may arise in the right lateral and the posterior aspects respectively of the anal canal. From the left lateral vessels piles may arise in the left posterior, the left anterior, and the anterior aspects. Careful digital and proctoscopic examination will reveal the exact number, degree, and position of any piles that may be present.

In their early stages the only symptom of piles may be a little blood with the action of the bowels. The dilatation of the veins produces a thinning of the overlying mucous membrane, which readily becomes eroded and allows small haemorrhages to occur. Sometimes a little sense of fullness in the anal canal is experienced. They are difficult to feel on palpation but are easily seen on proctoscopy. As the vessels dilate the mucosa becomes thickened, fibrosis occurs beneath its surface, and the piles become big enough to be extruded from the anal canal. In this, the second stage they are troublesome lead to irregularity of the action of the bowels come down with the straining of defaecation, but, on account of the changes of their surface do not tend to bleed. They usually go back by themselves, and, apart from a sense of discomfort, do not produce a great deal of disability. Both these stages of piles respond well to the injection treatment. At the Gordon Hospital for Rectal Diseases we have found that a large injection of 10 ccm of 5 per cent phenol in almond oil into the upper part of the pile gives the best results. Only one pile is treated at a time the remainder at weekly intervals, and then a period of four to six weeks is allowed to elapse before the case is reviewed to ascertain if further injection is necessary. Two points of technique are important. The dentate or pectinate line of nerve endings must be recognized and the injection given well above it, otherwise such severe pain will be experienced that the patient will never return for further treatment. Secondly the needle must be inserted obliquely and for not more than one centimetre, and if this is observed carefully no bad effects will follow.

The third stage of piles is when they have enlarged so much that even the thickened mucous membrane has again become thinned and multiple erosions occur on its surface. The piles themselves have become so large that they come down with each action of the bowels, and even with slight exertion. They do not return of their own accord and have to be pushed back, and even then cannot with ease be retained inside the anal canal. Through the

eroded surface of the mucous membrane infection among the veins and into the perianal lymphatics occurs and any form of treatment other than operative is fraught with a definite degree of risk. Although it is true that large numbers of patients are much relieved by the injection treatment even in the third stage yet there is no doubt that the modern operation carries no risk and has the most satisfactory and lasting results.

Contrary to general opinion the modern ligature operation carried out with careful pre-operative and post-operative medication under intravenous anaesthesia and accompanied by the technique of division of the pecten band (pectenotomy) may be rendered so free of discomfort that it is surprising that a horror exists still to such a marked degree in the minds of so many of the public. One extremely valuable recent addition in the post-operative care of these cases is with reference to the frequently accompanying retention of urine. This is of course purely spasmodic in nature and the spasm is readily overcome in the vast majority of cases by the subcutaneous injection of 1 ccm. of esmodin which has often worked like a charm.

Abscess and Fistula

An abscess in the region of the rectum or anus is usually produced by an infection reaching beneath the wall of the canal in the region of the pecten as detailed above. The pain which accompanies the condition may of course be soothed by the application of heat but an incision too soon rather than too late should be made as a track is almost invariably present leading from the abscess cavity into the anal canal either superficial to or between the fibres of or deep to the external sphincter. This can often be laid open freely at the time of the original incision. If such a track is not laid open the abscess is frequently converted into a fistula and then a subsequent operation is necessary in order to cure the fistula. Many workers in this field of surgery have felt and still feel reluctant to endeavour to cure the condition in one operation. We have employed a one-stage operation on several hundred cases and while no inward track has ever been noted a complete cure has been obtained except in a small minority of cases. If a fistula has been allowed to develop it must be laid open freely into the anal canal provided the internal sphincter is not divided. If the external sphincter is not divided with complete division of the external sphincter there is a risk of so con-

tracting the British housewife loves to do her most thorough darning in the area which is the seat of pruritus ani, these patients often improve considerably if their underclothes are made of pure silk or at any rate artificial silk. Local pathological conditions especially piles and cryptitis with a greater or lesser degree of pectenosis account for the vast majority of cases. If these pathological conditions are radically dealt with the pruritus usually disappears. Palliative treatment however will effect a cure in an early case. Mercury ointment applied well inside the anal canal will have an astringent effect upon the mucous membrane of the pile-bearing area. The skin may be treated for a few seconds with 20 per cent carbolic acid in glycerin followed by the application of an ointment. The following is a valuable prescription.

Powdered zinc oxide	3 drachms
Liniment of camphor	2 drachms
Sterile white vaseline	to 2 ounces

If more analgesia is required 10 grains of pericaine hydrochloride may be added. Nestosyl ointment is also often efficacious. Careful attention to the bowels is important. The drug which appears to have the most satisfactory stimulating effect upon the last few inches of the large intestine is senna and perhaps the most popular and satisfactory method of administering this is as follows.

P	Puls. fol. sennae	} ad 3 grains
	Puls. rad. jalap.	
	Puls. sulph. sublim.	
	Theriacale nigrae	ad 1 drachm

This taken regularly at night time in smaller or larger doses according to how it suits the patient gives a regular solitary and adequate evacuation of the bowels each morning. Still more advanced and intractable cases however always show physical signs of definite functional or hysterical tendencies—for example exaggerated knee jerks, loss of corneal reflex and areas of patchy anaesthesia. In addition to a radical cure of the local underlying causes by operative intervention careful treatment with nerve sedatives and helpful suggestion may be accompanied by small doses of x-rays (half an e.v.h. unit) twice together with the local application of a bland oily substance.

Rectal Tumour

(a) *In the Child*.—The commonest tumour in the child is a small adenoma about the size of a cherry which causes the occasional appearance of blood in the stool.

length of the large intestine. If they are not treated malignant changes almost invariably supervene after a period of years. Careful x-ray and sigmoidoscopic examinations are essential in order to ascertain exactly the state of the whole of the large intestine. No barium enema radiograph is complete without draining off the barium and taking a further picture after air replacement. A localized adenoma may be successfully treated with diathermy provided that microscopical examinations of portions of it have shown that it is not malignant, and frequent subsequent examinations are made over a period of years to ascertain that there is no recurrence.

Cancer of the Rectum

Cancer of the rectum is almost always a carcinoma, rarely a sarcoma, and this disease constitutes more than one third of all the cancers of the alimentary canal, including even the mouth. It occurs in three positions: (1) at the anus, (2) in the ampulla of the rectum, (3) at the recto-sigmoid junction.

Carcinoma of the Anus—This is usually seen at an early stage as it is accompanied by pain and the presence of a typical ulcer which bleeds easily, and the inguinal glands of the affected side are soon involved. The most satisfactory treatment consists in removal not only of the ulcer but of a large margin of apparently healthy surrounding tissue on each side and deeply, together with extirpation of the inguinal glands. In this situation, and in this situation only in dealing with rectal neoplasms, radium or radiation therapy may be made to play an important part.

Carcinoma of the Ampulla of the Rectum—A long latent period exists between the commencement of a carcinoma of the ampulla and the onset of symptoms. This may extend to several months, and often the first symptom is nothing more than a sense of fullness of the rectum after the bowels have moved. When this has been present for some time there may be a sudden attack of either diarrhoea or constipation, and ultimately the frequency of the bowel action becomes definitely increased. Diarrhoea occurs, accompanied by the passage of blood and mucus, the sense of fullness gives place to a definite aching, and the patient begins to lose both weight and appetite. The diagnosis is easy, provided a careful digital examination is made.

Carcinoma of the Recto sigmoid Junction—Here again the onset of symptoms may be delayed long after the growth has made its appearance. The first symptom is usually a definite attack of *altered bowel action*. For example, a patient who has been perfectly regular in his habits suddenly gets an attack of obstinate constipation, which may continue for several days or weeks in spite of a large variety of aperients. Another patient, who has been habitually constipated is suddenly delighted to find his bowels acting freely. Not until definite stenosis occurs and the condition has become considerably advanced do the well known symptoms of alternating diarrhoea and constipation make their appearance together with the passage of blood and mucus. The diagnosis is not by any means easy. Examination with the right index finger with the patient lying in the left lateral position seldom enables the examiner to detect the growth. If however the patient is examined with the left index finger with the patient lying in the right lateral position, the recto-sigmoid region is usually brought within reach of the finger and an early diagnosis can be established. Every suspicious case should in addition to a digital examination have a sigmoidoscopic examination and this should be done before, and not delayed till months after, a barium enema

Operability of Cancer of Rectum

The vast majority of cases of cancer of the rectum are alleged to be inoperable when they are first seen. First, because a large number of medical practitioners still believe that every cancer of the rectum is inoperable. Secondly, because in many of these cases there is a mass of impacted faeces due to the obstruction and to the powerful peristaltic action of the large intestine, and when the rectum is examined the whole mass is mistaken as being fixed, immovable, and quite inoperable. If the examination is repeated after seven or ten days of careful aperientization and wash outs, it is often found that a large proportion of the mass has disappeared, and the condition obviously is now freely movable and easily operable. Thirdly, with modern technique many patients who were thought to be inoperable a mere ten years ago are now found to survive the operation without any undue anxiety, and operability has risen in our hands from 30 per cent to over 50 per cent.

Palliative Treatment

Colostomy—A well established colostomy in the left iliac fossa, consisting of the exteriorization of a complete loop of the sigmoid colon, subsequently treated with one daily wash-out, is a most satisfactory operation. In the inoperable case it should be performed early rather than late. Owing to careless management a colostomy was for a long time regarded as producing more distress than otherwise, but in recent years its regulation is so satisfactory that its advantages are considerable in the majority of cases.

Diathermy—In patients whose general condition prohibits the employment of radical treatment diathermy has a definite and most useful place, and in cases in which the growth is inoperable a painful and discharging growth may be kept almost symptomless, sometimes for many years.

Radium—Except at the anus, cancer of the rectum is markedly radio-resistant, and my experience has led me to believe that its use in this position as a general rule does more harm than good.

Radical Treatment for Cancer of Rectum

The cure of cancer of the rectum depends upon three main factors: (1) the knowledge of the pathological paths along which the growth tends to spread, (2) the planning of an operation to include as much as possible of the fields of spread, (3) careful pre-operative, operative, and post-operative attention.

1 PATHOLOGICAL PATHS OF SPREAD

The way in which cancer of the rectum spreads was clearly and accurately demonstrated by Mr Ernest Miles over a quarter of a century ago, and the present position of the treatment of cancer of the rectum throughout the civilized world has been built upon his well laid foundations. Cancer of the rectum spreads by lymphatic channels in three directions: (a) downwards towards the ischio-rectal fossae, (b) laterally on the levatores ani muscles, and (c), most important of all, in an upward direction along the course of the inferior mesenteric artery, and thence laterally towards the wall of the pelvic colon.

2 PLANNING OF AN OPERATION

The earliest possible removal of the widest possible field gives the largest percentage of cures in cancer of any organ. Cancer of the rectum is no exception. In fact,

radical extirpation by the abdomino perineal method produces the highest percentage of cures compared with those in any other situation. It is believed that anything short of a radical operation is literally playing with a patient's life and while isolated instances of operations that have preserved the sphincters (though not always preserved control) are recorded it must always be recognized that anything short of an operation which includes all possible fields of lymphatic spread though frequently proving a brilliant success for a year or two is a gamble in which the patient's life often ultimately becomes forfeit.

When operating for cancer of the rectum three main surgical principles should be borne in mind.

(a) As indicated above not only the growth but also all removable fields of lymphatic spread must be extirpated as widely as possible. As the upward spread demands the most careful attention extirpation should be effected up to the point where the left colic artery arises from the inferior mesenteric artery.

(b) Before a primary growth is tampered with or manipulated in any way the majority of the blood and lymph vessels which are liable to transmit metastatic cells to the venous and lymphatic circulation should be ligated when possible. This is easily done in the abdomino-perineal operation in which the first step is to tie a ligature around the inferior mesenteric artery and vein and the accompanying lymphatics opposite the bifurcation of the abdominal aorta. Primary dissection is therefore carried out as far as possible from the original growth as is also all subsequent dissection.

for several hours and is followed by less fall in blood pressure than with other types of spinal injection and by no untoward sequelae. Ether and chloroform are rigorously excluded and general anaesthesia is continued by nitrous oxide oxygen.

Details of operative technique are too many to outline here but two important points should be mentioned.

(i) *Absolute Aseptic Intestinal Division*—This is carried out by Mr. Zachary Cope's modification of De Martell's three bladed clamp. When the bowel is to be divided the three blades are applied and the centre one removed. Division is then carried out between the two clamps which are left *in situ* by means of the actual cautery and an absolutely aseptic division of the intestine thereby takes place. This ingenious instrument would not appear to have received the recognition it deserves.

(ii) *Presacral Neurectomy*—As it is impossible to carry out a radical removal of the rectum without damaging the parasympathetic nerves it is advisable to relieve the bladder of a tonic contraction of its sphincter by removing the presacral nerve as a routine. The effect of this has been to abolish the need for a catheter except in the small minority of cases thereby preventing urinary infection and making the post-operative period much easier. At the same time the path of deep pain impulses is removed.

Post-operative Treatment

Over thirteen years ago I began to give a Hard train course as a routine post-operative measure for all cases of

ABNORMALITIES OF GROWTH AND DEVELOPMENT

THE CLINICAL AND PATHOLOGICAL ASPECTS*

BY

H. GARDINER HILL, M.D., F.R.C.P.

Physician to Out-patients St Thomas's Hospital

ARREST OR RETARDATION—DWARFISM AND INFANTILISM

The conditions of dwarfism and infantilism can be considered together for although dwarfism is not infrequently found without infantilism the two are more frequently combined. Both represent disturbances in the growth sphere but whilst in dwarfism the defect is skeletal and limited to the skeleton in infantilism the retardation of development is general.

The term dwarfism implies a defect in stature below the normal standards but does not necessarily signify a pathological state for dwarfism under certain conditions may occur without any evidence of disease. In simple dwarfism the skeleton is of small size but the bodily characters and functions—especially in the sex sphere—are appropriate to the age of the individual. The skeleton may be proportioned or disproportioned. If disproportioned the defect may be either in the trunk or the limbs—an abnormality of the spine or the long bones. In either case the underlying cause may be developmental or acquired.

The term infantilism is more difficult to define, and is often used ambiguously. Strictly speaking, it should be reserved for more or less permanent conditions in which the physical and psychological attributes of childhood persist into adult life—smallness of stature underdevelopment of the musculature, a head large in proportion to the body comparatively short limbs, lack of function of the genitalia and certain qualities in the mental sphere. This strict interpretation of the term, however, is not generally adhered to and there is a tendency to include conditions of temporary delay in development in which the stage reached is less than that appropriate to the age of the individual. This is perhaps justifiable if the wide sense in which the term is used is clearly understood. The term infantilism however should not include pathological states such as eunuchoidism, in which retardation or arrest of development in one sphere—in this instance the sex sphere—without any general disturbance of growth and development is found.

It is obvious from our consideration of the many factors which influence the growth process that there must be a number of different causes of dwarfism and infantilism. Physiological and pathological varieties both occur. Dwarfism may be a separate entity in simple hereditary dwarfism and in achondroplasia and allied conditions. The various forms of rickets are also accompanied by growth defects, and in the coeliac and renal forms where there is a pronounced interference with general metabolism infantilism results too.

The different forms of infantilism are difficult to classify but there are two main groups. In the first due to endocrine deficiency the underlying cause may be hypopituitarism, hypothyroidism, or hypogonadism. If the underlying condition is untreated the physical and psychological attributes of childhood persist into adult life. To the second group the term cachectic has been

applied, and it includes those in which retardation or arrest of development has resulted from malnutrition, metabolic disturbance, or chronic infective disease. A convenient classification of the different varieties of dwarfism is as follows:

Simple Dwarfism

1 Simple hereditary dwarfism

2 Simple dwarfism due to developmental skeletal disease (a) achondroplasia chondro osteo-dystrophy and dyschondroplasia (b) osteogenesis imperfecta

3 Simple dwarfism due to acquired skeletal disease (a) simple rickets and late rickets, (b) spinal caries and spinal deformities due to other causes—for example poliomyelitis

4 Hypergonadal dwarfism

Dwarfism and Infantilism

1 Cachectic

2 Cachectic infantilism associated with more specific changes at the growth cartilages (a) congenital syphilis, (b) scurvy (c) coeliac rickets, (d) renal dwarfism.

3 Endocrine (a) hypopituitary (b) hypothyroid, (c) hypogonadal

1 True Hereditary Dwarfism

True hereditary dwarfism should not be regarded as a pathological condition, for apart from the defect in stature neither the skeleton nor other organs of the body show any evidence of abnormality or disease. These individuals are entirely normal apart from their small size. Puberty occurs at the normal age and sex function is normal. Hereditary dwarfism is essentially a hereditary characteristic and dependent on chromosomal constitution. The racial form is typified by the Norwegian Lapps, Central African pygmies, and inhabitants of the Andaman Islands. Many striking examples of the familial variety have been reported and a complete description of them has been given by Hastings Gifford (1911). Growth is slow and far below average, and this applies to the differential growth of the skeleton too.

2. Simple Dwarfism Due to Developmental Skeletal Disease

(a) ACHONDROPLASIA CHONDRO-OSTEO-DYSTROPHY AND DYSCHONDROPLASIA

Amongst the developmental conditions producing simple dwarfism achondroplasia and the closely related entities, chondro-osteo dystrophy and dyschondroplasia, must be considered. Some authorities take the view that achondroplasia, dyschondroplasia (Ollier, 1899), chondro osteo-dystrophy (Morquio, 1929), and hereditary deforming dyschondroplasia (metaphyseal aclasis) are only different manifestations of one pathological state—dyschondroplasia, by which term is implied a nutritional defect of the growth cartilage. This view is held by Parsons (1936) who suggests that achondroplasia could be regarded as the extreme form—namely, an aplasia—with the others as intermediate varieties.

From the pathological and clinical aspects there are certain points of distinction.

In achondroplasia the most striking feature is a mucoid degeneration and absence of cell proliferation in the growth cartilages. The normal palisade arrangement of the cells—that is, the normal scaffolding—is absent. Ossification is consequently hindered by the absence of this scaffolding, and longitudinal bone growth interfered with.

The term chondro osteo-dystrophy has been applied to several ill understood conditions. The earlier cases were reported by Brailsford (1929) and Morquio, who described

*The Oliver Sharpey Lectures delivered before the Royal College of Physicians of London on March 16 and March 18 1937. Lecture I was published last week.

irregular development of the metaphyses and epiphyseal ossification centres. The latter appeared as multiple foci which either fused gradually or became distorted and fragmented in joints subjected to pressure. In the vertebral column affected vertebral bodies became irregular in shape and size, the result of compression from the superimposed weight of the vertebral column. The chondro-osteo-dystrophy of Brailsford and Morquio bears a close resemblance to cases reported by Dickson Wright (1930-1) as generalized osteochondritis, in which every epiphysis in the body became fragmented and distorted, and by Thursfield and Lightwood (1930-1) as "stippled epiphyses"—a case with clinical features suggestive of achondroplasia but, radiologically, fragmented epiphyses. The fundamental disturbance in the growth cartilage of this case, described later by Harris (1933c), was a mucoid degeneration more pronounced in the centre of the epiphysis than at the metaphyseal line, but otherwise identical with that in achondroplasia. There was an attempt in certain areas to form cartilage cell columns, but no continuity in the orientation of the cells for any distance.

The term dyschondroplasia has been coined by Ollier to describe the condition at the growth cartilage in which cartilage cell proliferation—that is, the scaffolding—is present in excess, but the subsequent senescent processes of degeneration, calcification, and ossification do not occur. As the bone develops masses of unossified cartilage persist at the metaphysis. Hereditary deforming dyschondroplasia is a variety of this condition with additional features—an unmodelled metaphysis and exostoses.

From the clinical aspect all these conditions have much in common, and dwarfism is generally pronounced. The achondroplasiac certainly appears to represent the extreme form in which the whole skeleton is affected and the changes are present at birth. The characteristic appearance is produced by a combination of normally sized trunk and short limbs, particularly the proximal segments, a relatively large head and small face with depressed nasal bridge, and trident hand. The disproportion between limbs and trunk is most pronounced. A lumbar lordosis usually produces an undue prominence of the abdomen, and the gait is of an odd waddling character. Dentition, sex, and mental development are normal. Radiology of the skeleton shows characteristic changes. In the child and adolescent the space between the epiphysis and metaphysis is smaller than normal and the metaphyses tend to be unduly splayed and broadened near the joints, producing the characteristic petunia-like appearance, due to failure in the modelling process.

The dwarfism of chondro-osteo-dystrophy is very similar, but the child is normal at birth and the head and facial changes are not found as in achondroplasia. The proportions of the skeleton depend on whether the vertebral column or limb bones are more affected. In some cases both are the site of characteristic changes, in others the defect is localized to one or other. The diagnosis can be confirmed by radiology, when fragmentation of the epiphyses will be found. In some instances this condition improves as the child grows older, but although a satisfactory growth rate is resumed a degree of dwarfism results.

The clinical pictures of dyschondroplasia and hereditary deforming dyschondroplasia are similar to the above but the limb bones are chiefly affected and deformities bowing or genu valgum may be present. In both a short-limbed skeleton is usually found. In the hereditary type the characteristic radiological features are an irregularly expanded metaphysis with exostoses. The progress of

the condition can be judged from the story of a family, and particularly two sisters, who came under my personal observation. In the younger, a dwarf aged 8, the features of dyschondroplasia were first noticed at the age of 18 months. At 8 she had a strikingly disproportioned skeleton: symphysis-vertex 54.5 cm, symphysis-soles 35.5 cm. The limbs were short and there was enlargement and typical radiological changes at the metaphyses. She happened to be the ninth child of a family of ten, of which the third, fourth, and tenth members were also subjects of this condition. Radiological examination of the metaphyses of her elder sister (No. 4, aged 14) by the same radiologist, at the age of 11 had shown an identical condition, but a second examination carried out three years later—at the age of 14—demonstrated that the metaphyseal abnormalities had disappeared. At the age of 14 this girl was still strikingly dwarfed and her height was only 4 ft 4½ in. Her skeleton was disproportioned and of the short limbed type: symphysis-vertex 28½ in, symphysis-soles 24½ in. The changes of puberty were normal and well advanced.

(b) OSTEOGENESIS IMPERFECTA

Osteogenesis imperfecta must be included among the developmental skeletal diseases leading to simple dwarfism owing to the scoliosis, stunting of long bones, and deformities following the fractures which invariably occur. Apart, however, from the deformities from healed fractures, the bones are actually shorter, thinner and smaller than normal. The epiphyseal cartilage is normal, but in the metaphysis the trabeculae are slender and delicate and are widely separated by interstices filled with cellular connective tissue. The underlying abnormality in osteogenesis imperfecta is a generalized disturbance of osteogenesis, according to Knaggs (1926), a failure of differentiation of osteoblasts. The resulting growth defect depends much upon the deformities and the age at which the condition manifests itself. In the infantile form there may be stunting and evidence of fractures at birth, but these children seldom survive to adulthood. In the adolescent type the child may appear normal at birth, but the tendency soon manifests itself, and repeated fractures result in deformities and skeletal dwarfism. The radiological changes in the bones are characteristic: an almost complete absence of cancellous tissue, and the cortex appears as a faint line.

3 Simple Dwarfism Resulting from Acquired Skeletal Disease

In discussing the factors which limit growth, reference was made to Harris's investigations showing that changes of premature senescence in growth cartilage and temporary arrest of growth result from the infective and metabolic diseases of childhood. In fact, a quick succession of severe diseases during adolescence has been observed to cause permanent arrest of growth with complete union of the epiphyses. Dwarfism then results, but often without infantilism. Apart from these cases there are two types of dwarfs which require consideration in this section: (a) due to simple and late rickets and (b) to spinal caries or other spinal deformity.

(a) SIMPLE DWARFISM AND RICKETS

The era before the recognition of the cause of rickets was responsible for many examples of rickets deformity and simple dwarfism. The pathological process, as is well known, is due to vitamin D deficiency and consists of a softening and deformity of the bones from deficient

deposition of calcium phosphate, and especially imperfect calcification and ossification at the epiphyseal line. The cartilage cells proliferate excessively, and become converted in a patchy manner into tissue resembling bone but very deficient in lime salts—the so-called osteoid tissue. The intensity of the process is directly proportional to the rapidity of growth, for the non-growing animal does not develop rickets. A similar vitamin D deficiency in adolescence leads to late rickets, a comparatively rare condition, and, in adults, when all bone growth has ceased to a general rarefaction and softening of the skeleton—osteomalacia. Owing to the softening of the bones in these rickety conditions, the skeleton, and particularly those parts which are subjected to muscular strain or the influence of posture may be greatly deformed. In the first rachitic dwarfism with severe deformities was not infrequently seen. Now since the recognition of the cause of rickets it is a condition of extreme rarity. A study of a series of children with defective growth, however, does suggest that inadequately treated simple rickets in infancy may produce considerable degrees of dwarfism, noticeable only in later years. With adequate treatment rachitic osteoid tissue is replaced by healthy growing bone in the course of three or four months and this is the measure of interference with growth. Nevertheless, in my series of cases brought for defective growth alone, 20 per cent gave a history of infantile rickets as the only likely causal factor. Slight stigmata of past rickets could usually be found, and the skeleton was disproportioned as a rule and shorter in the lower measurement than in the upper. The intelligence and genital sphere developed normally.

Late rickets is also a cause of dwarfism, and must be distinguished from rickets of the coeliac and renal types. Typical rickety changes occur in the skeleton, and stunting of growth may be pronounced. Late rickets, rarely seen now, tends to develop during the active growth periods of the second dentition and puberty.

(b) SIMPLE DWARFISM DUE TO SPINAL CARIES AND OTHER SPINAL DEFORMITIES

For the sake of completeness mention must be made of the forms of simple dwarfism due to spinal caries and other spinal deformities. The skeletal deformities are of the short trunk type. A good illustration is the hunch-backed dwarf in whom angulation of the spine has resulted from vertebral tuberculosis. The site of the vertebral lesion is usually in the lower thoracic region, and the tuberculous process begins as a rule in a single vertebra, as a nutritional disturbance of the marrow following a tuberculous endarteritis. Absorption and caseation take place and sooner or later the vertebral shell collapses from the superimposed weight of the vertebral column. A kyphosis and angular deformity then results. Other diseases of the vertebral column occurring during the developmental period may produce dwarfism of the short trunk type, and occasionally examples have been observed from muscular atrophy following anterior poliomyelitis.

4 Hypergonadal Dwarfism

The occurrence of hypergonadal dwarfism has already been fully discussed under the heading of macrosomia praecox. It was then pointed out that although these syndromes are associated with transitory overgrowth in childhood, accompanied by sexual precocity, dwarfism ultimately results owing to premature epiphyseal fusion.

Before we pass on to a consideration of the conditions in which dwarfism and infantilism are combined let us briefly review the main features of simple dwarfism. In

some instances the statural defect is largely due to deformity, as in the dwarfism of osteogenesis imperfecta, spinal caries, and other conditions of the group. Much depends on the extent of the skeletal abnormality, which varies from a generalized disturbance of osteogenesis with multiple fractures in osteogenesis imperfecta to a localized infective process, perhaps in a single vertebra, in spinal caries. In the main varieties of simple dwarfism, on the other hand, the site of the pathological disturbance is the growth cartilage. It varies from mucoid degeneration and scaffolding defects in achondroplasia and allied conditions to cartilage cell proliferation with imperfect calcification and ossification in rickets. In hypergonadal dwarfism, premature senescent changes occur in the cartilages from the action of the sex hormones, and there results early epiphyseal fusion with cessation of growth. Similar changes and dwarfism have been found as a result of a series of infective diseases in adolescence. The growth and differential growth curves in these individuals are determined largely by the age of onset and severity of the pathological process, and by the nature and degree of permanence of the lesion. The most severe statural defects are found in achondroplasia and allied conditions where the degenerative process dates to foetal life, and, in the present state of our knowledge, is permanent and irremediable. In rickets, on the other hand, even when inadequately treated, the cartilage changes are more temporary and the damage done not irreparable. A disproportioned skeleton is liable to result because the long bones at the 'springing up' periods are especially interfered with.

Dwarfism and Infantilism

Conditions in which dwarfism and infantilism are combined may be considered under three main headings: (1) simple cachectic infantilism, in which retardation or arrest of development, general and skeletal, results from some serious chronic wasting disease in childhood; (2) cachectic infantilism complicated by more specific changes at the growth cartilages as in congenital syphilis, scurvy, and coeliac and renal dwarfism; (3) endocrine infantilism where arrest of development results from anterior pituitary, thyroid, or gonadal deficiency.

1 Cachectic Infantilism

Cachectic infantilism has been variously described as Lorain's (1871) infantilism, infantilo-chétivism, or dystrophic infantilism. The essential aetiological factor is a chronic wasting disease occurring during the growth period. This causes retardation of general development and 'lines of arrest' in the growth cartilages. The skeletal and other systems of the body are affected proportionately. Any condition of prolonged illness in childhood may produce such a result, but especially important are gastrointestinal diseases in which there is long standing interference with nutrition. Chronic abdominal tuberculosis and coeliac disease provide the most typical examples. The latter condition will be considered in a separate category owing to the rickety changes which occur. The infantilism of congenital syphilis, scurvy and chronic interstitial nephritis will also be grouped with coeliac disease as here also special epiphyseal changes complicate the picture. The nutritional disturbance from dietetic restriction in young diabetics before the introduction of insulin therapy has also been observed to result in considerable retardation of growth and development, amounting in severe cases to infantilism. Other causes of cachectic infantilism are inanition from underfeeding, chronic dysentery, and intes-

tinal worms In regions where malaria and hookworm disease are prevalent both have been found to lead to serious delay in development Cases of hepatic and hepatosplenic infantilism have been reported in the literature, but it seems reasonable to classify them under this rather than under a separate heading The interference with metabolism can be held responsible for the delay in development Hepatic disease does not appear to be a common cause of infantilism, for the reason probably that, if the hepatic lesion is severe, death occurs before development is interfered with, whilst, if the lesion is slight, liver function is not seriously affected and infantilism does not result

In cases of cachectic infantilism seen in later years an adult type skeleton is usually attained Much depends on the severity of the illness and the time at which the pathological process began The interference with growth at the growth cartilages is not, as a rule so pronounced as in the rickety and endocrine forms The nature of the pathological changes and the process of formation of lines of arrested growth have already been considered Development may be severely retarded, but adulthood is ultimately attained

In describing the clinical features of cachectic infantilism the original description of Lorain (1871) cannot be bettered The physique remains feeble and the general bodily form is small, the skeletal proportions are normal the genitalia appear diminutive, but are in proportion to the bodily size There is no defect in intelligence but the mind remains childish The changes of puberty do not occur at the normal age, and may be delayed until 18 or 20 Even then they may not be normally established, but in later life fuller development is usually reached This description is very typical of the majority of cases of cachectic infantilism It need only be added that radiological examination shows that osseous development is not disproportionately retarded if considered in relation to body size Lines of arrested growth can be demonstrated in the diaphyses

2 Cachectic Infantilism Complicated by More Specific Changes at the Growth Cartilages

(a) CONGENITAL SYPHILIS

The retardation of growth and development not infrequently observed in congenital syphilis could be reasonably included under the heading of simple cachectic infantilism were it not for the specific changes which may occur in the growth cartilages, interfering with growth in the long bones and so producing a disproportioned dwarfism These changes are usually of the nature of a syphilitic osteochondritis as originally described by Wegner (1870) a chronic inflammatory process which destroys the normal arrangement of the cartilage cell columns The calcifying cartilage is interspersed with fibrous tissue characteristic of chronic inflammation, and the margin of the newly formed bone is irregular Radiographically the free edge of the ossification zone resembles a saw in which the teeth are irregular in size The clinical picture of retardation of physical development in congenital syphilis would not be so distinctive were it not for the presence usually of some of the other well known stigmata of this disease Other conditions in this group showing short limbed disproportion of the skeleton scurvy and coeliac and renal dwarfism require differentiation but the radiological and other signs should make the diagnosis clear Harris (1933e) has pointed out one important distinction between these conditions whilst syphilitic osteochondritis especially affects the slow growing cartilages those at the proximal end of the femur and distal end of the tibia the changes of scurvy

and rickets are usually manifested at the fast growing cartilages in the neighbourhood of the knee

(b) SCORBUTIC INFANTILISM

Although scurvy from vitamin C deficiency—Barlow's (1883) disease—in its chronic form and of sufficiently long standing to be productive of infantilism must now be a very rare condition, when it has been observed specific changes have been found at the growth cartilages which have seriously interfered with growth Pathologically the process in the growth cartilage consists of a haemorrhage from the capillary loops which disrupts the newly formed bone and calcified cartilages and thus interferes with their nutrition The haemorrhagic clot may be replaced by fibrous or in certain instances bony tissue Cassidy (1922-3) has reported a striking example of scorbutic infantilism which showed the typical clinical picture A boy of 18 had never eaten either fruit or vegetables He first developed scurvy at the age of 13 with haemorrhagic swellings in the muscles of the legs, and was unable to walk Subsequently under antiscorbutic treatment, he improved, but soon reverted to his favourite diet At 18 there was striking retardation of growth and development and the changes of puberty had not appeared He was bed ridden and, although then able to move his feet his lower limbs were otherwise powerless Radiological examination showed the presence of remarkable conical structureless opacities at the ends of the diaphyses of the long bones most evident around the knee These opacities suggested previous haemorrhages in which bony changes had taken place Otherwise there was extreme rarefaction of the skeleton and in both femora evidence of recent fractures This case illustrates the severe retardation of growth and development which follows prolonged vitamin C deficiency

(c) COELIAC RICKETS

The arrest of development in long standing cases of coeliac disease is often very striking Smallness of stature is associated with general retardation of development The state of cachectic infantilism however, is complicated by the presence of rickety changes in the metaphyses which interfere with the growth of the long bones and produce a short-limbed, disproportioned skeleton Radiologically, the development of the epiphyseal centres of ossification corresponds to the size of the individual The metaphyses are swollen and cupped as in rickets and the epiphyseal line becomes irregularly serrated Osteoporotic changes appear sooner or later in the shafts These rickety changes can be attributed to vitamin D deficiency the result probably of malabsorption or possibly of re-elimination from the intestines of fat and the dietary restrictions which have to be imposed on the individual

Clinically the general appearance is striking and very similar to that in hypopituitary infantilism except for the presence of rickety deformities Dwarfism is pronounced and the appearance of the secondary sex characters may be delayed until the age of 20 or later In the majority of cases a history of fatty stools provides the clue to the nature of the underlying condition

(d) RENAL DWARFISM

Renal dwarfism from chronic interstitial nephritis in childhood provides a very similar picture It differs fundamentally from the other types in being due to the action of retention products—that is inadequate excretion of phosphates by the kidneys and consequent interference with calcium metabolism The underlying renal

condition is in many cases congenital. In fact, these children often show signs of renal inadequacy from birth, and as they grow older the bony deformities appear: the enlarged radial epiphyses, deformities of the long bones, and, later, genu valgum are characteristic of this condition. The urinary findings are similar to those of chronic interstitial nephritis in the adult, and at post mortem examination the kidneys have been found to show varying degrees of granular atrophy.

Growth is slow and development severely retarded, and the presence of rickets changes at the metaphyses through early years produces a disproportioned short-limbed skeleton. Radiologically the metaphyseal changes are difficult to distinguish from those of simple rickets, and a typically cupped and irregularly serrated metaphyseal line occurs. Mental development is unaffected, but the appearance of the secondary sex characters and the changes of puberty are much delayed. Perhaps the majority of cases of renal dwarfism do not survive until the age of puberty.

3 Endocrine Infantilism where Arrested Development Results from Glandular Deficiency

(a) HYPOPITUITARY INFANTILISM

An immense step forward in our knowledge of hypopituitary dwarfism and infantilism was made when it was shown that the removal of the anterior pituitary in young animals, notably puppies, produced arrest of growth and sex development. The testes remained in an infantile condition and the secondary sex characteristics failed to appear. The arrest of growth was particularly noticeable in the long bones, which were unable to increase their shaft length. Histological examination showed lack of formation of cartilage cells in the growth cartilages. Radiologically there was retarded osseous development and delayed epiphyseal fusion far beyond the normal time.

The most clearly understood pathological states causing hypopituitary infantilism are vascular lesions or tumours. Little is known, from the pathological aspect, of functional exhaustion of the anterior lobe. Of the vascular lesions Simmonds has described a syndrome, which now bears his name, of infantilism, cachexia, and defective growth from ischaemic necrosis of the anterior pituitary, the result of infarction generally from infective or acute illness. The deficiency syndromes in childhood due to compression from a tumour are those associated with the parahypophyseal and suprasellar cysts. As a rule the clinical picture is characterized by infantilism, dwarfism, and obesity: the syndrome of dystrophia adiposogenitalis described originally by Fröhlich. Whilst there is no doubt that cachexia usually accompanies the lesion described by Simmonds (1918) and adiposity the tumour syndrome associated with Fröhlich's (1901) name, on clinical as opposed to pathological grounds this nomenclature appears to be too rigid, for cachexia is sometimes found with parahypophyseal cysts and typical cases of Fröhlich's syndrome without any tumour. The difficulty in keeping to this nomenclature for clinical cases lies in the varying metabolic disturbances. The relation of the latter to the pituitary is not yet understood and it would seem better to classify cases as hypopituitarism with or without tumour. In adults compression of the cells of the anterior lobe may be due to another type of tumour, the pituitary chromophobe adenoma, but such adenomata only occasionally develop before the end of the second decade—that is before the developmental stage has passed—and consequently are not often associated with the hypopituitary syndrome of dwarfism and infantilism.

The growth defects in hypopituitarism are characteristic in cases antedating the second dentition. There is a striking disproportion of the skeleton, and the limbs are short in comparison with the trunk—that is, an infantile type of skeleton is retained. If, on the other hand hypopituitarism does not develop until after the second dentition, when the skeleton has reached a more mature type, the same degree of disproportion will obviously not be found. There is, however, a tendency for the growth of the long bones to be affected more than that of the trunk, and evidence of this will be found in skeletal measurements. Radiological examination will show characteristic delay in the appearance and development of the ossification centres. The epiphyseal disks remain ununited beyond the usual time. This growth defect, associated with sex infantilism, normal intelligence, and mental faculties, gives the typical picture of hypopituitary infantilism. Adiposity when present tends to be limited to the trunk, abdomen, hips, and proximal segments of the limbs, the subcutaneous deposits in the distal segments being scanty and the extremities spared. In hypopituitarism due to parahypophyseal cysts neighbourhood symptoms are present and radiological examination of the sella turcica gives a characteristic picture. The fossa is usually of the flat and open type, with erosion of the clinoid processes. Suprasellar or intrasellar shadows may be observed, and indicate areas of calcification in the cyst. The calvarium often presents characteristic features—a "beaten silver" appearance due to convolitional pressure and thinning from increased intracranial tension.

(b) HYPOTHYROIDIC INFANTILISM

Until recent years the thyroid has been regarded as the focal centre of pathogenesis in hypothyroidic dwarfism and infantilism. Varying grades of atrophy of the gland are found. Lately, however, it has been shown that the thyroid is under anterior pituitary control, so that in hypothyroidic states the possibility of a primary anterior pituitary pathogenesis must be borne in mind. It has been shown, for instance, that pituitary ablation is followed by hypothyroidism and that the anterior pituitary secretes a thyrotropic hormone which exercises its function through the mediation of the thyroid. One must bear in mind, therefore, the possibility of an anterior pituitary factor in hypothyroidic infantilism, and that the latter may be due to inadequate supplies of thyrotropic hormone.

In untreated congenital athyroidism dwarfism is pronounced, the long bones are affected more than the trunk and a disproportioned short-limbed skeleton results. The ossification centres are late in making their appearance in the cartilaginous epiphyses, and, when they do, they develop slowly. Growth may come practically to a standstill in untreated cases and the epiphyses may remain largely cartilaginous till the end of life. These changes can be demonstrated radiologically. Histologically, in the growth cartilages cell proliferation is much diminished and there is a want of orderly arrangement of the cells. Rounded groups of cells tend to occur and the normal palisade arrangement is not present. Some calcification of the matrix is seen, but its depth depends on the degree of cell proliferation (Knaggs, 1928-9).

In post nasal hypothyroidism a condition to which the term myxinfantilism has sometimes been applied, the resulting skeletal defects depend to a large extent on the age at which the thyroid defect develops. If it antedates the second dentition and the condition remains untreated a disproportioned skeleton with short limbs is found. In cases developing later and after the second dentition

retardation of growth in the long bones and skeletal disproportion are less pronounced. Disturbances in dentition go hand in hand with those of bone growth, and retardation of sex development in untreated cases is striking. The appearance of the secondary sex characters and changes of puberty may be indefinitely delayed. This picture with its associated mental retardation and myxoedematous skin changes is quite characteristic. The rate of growth and development when thyroid treatment is first instituted is often remarkable, but when once leeway has been made up further progress is on more normal lines.

(c) HYPOGONADAL INFANTILISM

(i) *From Pre pubertal Castration*—The effects of early castration in young animals are well known, but clinical reports of individuals, at any rate of the female sex, who have been castrated in juvenescence are extremely rare, if any exist. The details of such a case will therefore be of interest. Castration in adolescence results in characteristic changes in the skeleton. The growth of the long bones persists beyond the usual time, resulting in abnormal length of the limbs in comparison with the trunk. Such castrates usually grow tall, but, in the present instance of early castration, striking retardation was found. This patient, aged 19½ at the time of my observations, had had both ovaries removed at the age of 9½ for bilateral multilocular cystadenomata. As a result of the operation the changes of puberty did not occur and the secondary sex characters failed to develop. Her height at 19½ was only 5 ft 1½ in, the measurement from symphysis pubis to vertex being 27½ in and from symphysis pubis to soles 34½ in—that is, the length of the lower limbs was greatly in excess of that of the trunk. A remarkable feature of this case was the very great enlargement of the sella turcica, which was shown by radiological examination to be three to four times the normal size. No changes were found in the fundi or visual fields. Radiological examination of the carpus showed that ossification centres were present and of a more or less normal degree of development, though it should be remembered that the patient was approaching this state at the age the operation was performed. The epiphyseal junctions, however at the time of observation, had remained unfused. A modified Aschheim Zondek test gave a positive result, indicating the presence of gonadotropic substances in the urine. Does it not seem reasonable to assume that the growth defect in this patient, unusual after castration, was due to a failure of the normal secretion of growth hormone from the eosinophil cells of the anterior lobe? In view of the enlargement of the sella turcica noted in the radiograph the hypothesis could be advanced that an overgrowth of the castration cells of the anterior lobe had interfered with the function of the growth cells. An overgrowth of castration cells is consistent with the findings in the pituitary after castration in animals.

(ii) *Hypogonadal or Eunuchoid Infantilism*—Under this heading I will also quote a case which illustrates another most unusual condition—a combination of eunuchoidism, infantilism and dwarfism. This patient, a male, was aged 34 at the time of my observations. He was very small and wizened in appearance. His height was only 4 ft 3½ in, the measurement from symphysis pubis to vertex being 21½ in and from symphysis pubis to soles 30½ in—that is the length of the lower limbs was greatly in excess of that of the trunk, as in eunuchoidism. Neither testicle was palpable in the scrotum or inguinal canal and there was a complete absence of facial, pubic

and axillary hair. The skin changes and distribution of the subcutaneous fat deposits were also typical of eunuchoidism. Radiography showed that the epiphyses of the long bones were still ununited. The clinical features suggest that the primary lesion is gonadal rather than anterior pituitary. The condition differs from hypopituitary infantilism in the excessive length of limb as compared with the trunk, and from true eunuchoidism in the defect in stature. In ordinary forms of eunuchoidism the individual is of normal stature or tall, a feature which is ascribed to the persistence of growth in the presence of ununited epiphyses. The persistence of growth could be attributed to eosinophil activity in the anterior pituitary. It seems likely that in this diminutive and infantile individual the defect of growth may have resulted from a secondary eosinophil hypoplasia. There were no changes in the sella turcica, nor was there any evidence of pituitary tumour as judged by examination of the fundi and visual fields. On the other hand the general features and bodily dimensions of eunuchoidism strongly suggest a primary hypogonadal aetiology.

Other Forms of Infantilism

From time to time other forms of infantilism have been described, and although, if the above classification is adopted, it seems reasonable to include them in one or other of the categories they should be mentioned separately for the sake of completeness.

So-called cardiac dwarfism and infantilism may be cited as an example. It would be generally agreed that severe cardiac lesions may cause interference with growth, and congenital abnormalities in particular are sometimes associated with arrest of development. On the other hand, congenital heart disease is known to be consistent with average development, and even when retardation does occur it is difficult to be sure that both cardiac and general maldevelopment are not part of a more widespread abnormality of the germ plasm. Mitral stenosis of rheumatic origin has been regarded as a cause of dwarfism. That it cannot be a common cause is evidenced by the number of children with it who grow and develop satisfactorily. There is certainly little evidence that cardiac lesions of this type produce any serious arrest, for the changes of puberty and secondary sex characters usually develop in a normal way. In fact, in cases which have been reported the defect has usually been one of stature rather than of general and sexual infantilism.

Some reference is also necessary to the condition described by Gandy (1906) as retrograde infantilism in which there is found a regression of sex characters and functions towards the infantile state. The cases described have almost invariably had their onset in adult life so that skeletal dimensions and proportions have not been affected. In the light of recent knowledge it would seem that some of these cases at any rate fall into the category of late eunuchoidism, in which a late atrophy of the sex glands occurs. Others judging by the presence of hypothalamic symptoms have probably been of hypopituitary origin. In some instances thyroid atrophy has been reported and here the gonadal defects have probably been secondary to hypothyroidism. So-called retrograde infantilism therefore seems to include a number of different conditions. In any case as the skeletal dimensions are normal it does not seem justifiable to place them in the category of true infantilism.

Finally infantilism in association with Addison's disease has been reported in one striking case by Morlat (1903) and in a somewhat similar one by Apert (1933).

under the tentative heading of suprarenal infantilism. The latter points out that bilateral tuberculosis of the suprarenal cortex causing Addison's disease is rare in childhood, and such lesions if they do occur, usually prove fatal before infantilism can develop. In the two cases mentioned dwarfism and infantilism were associated with pigmentation, asthenia, anorexia and wasting. In Morlat's case, though the stature was small, the proportions of the head, trunk and limbs were those of an adult. In the scheme of classification adopted in these lectures these cases could therefore reasonably be grouped in the category of cachectic infantilism.

A survey of the field of clinical and pathological abnormalities of growth and development shows that we are concerned with the influence and interaction of four groups of factors, nutritional, infective, endocrine, and hereditary, in the production of two different groups of phenomena—alterations in bodily size on the one hand, and variations in the time factor of development on the other. Abnormalities of stature such as gigantism and dwarfism and abnormalities of development, precocity and infantilism are clearly associated closely, and occur together in a number of different combinations.

Our knowledge of some of the factors which modify growth and development is still very deficient. The influence for instance of over nutrition and hypervitaminosis is not understood though the effects of under nutrition, hypovitaminosis, and infective disease in limiting growth and retarding development are becoming more clearly defined.

Our understanding of the endocrine factors has advanced in the last decade. Experimental work with the anterior pituitary growth hormone has shown its capacity for stimulating bodily growth, and its effects on the growth cartilages and general bodily tissues can be appreciated from clinical observations in hyperpituitary gigantism and hypopituitary dwarfism. The equally important influence of the sex hormones in permitting or limiting longitudinal growth by controlling the time of fusion of the epiphyses can also be judged from the various pathological conditions in which sex hormone production is disturbed. The sex hormones appear to produce senescence in growing cartilage, a maturing effect comparable to that seen elsewhere in the body. It is only necessary to remind ourselves that sex hormone production is primarily under anterior pituitary control to realize how important in growth and development is the anterior pituitary body. Further knowledge with regard to the site of production of the anterior pituitary sex hormones, and histological evidence as to the cell counts in the anterior pituitary in different pathological states of growth and development, should do much to help our understanding of these conditions.

The influence of heredity in growth and development is not within the scope of these lectures but it is evident that hereditary influences have played an important part in a number of the conditions we have been studying. The importance of genetic factors in determining endocrine constitution can only at present be surmised, but it is in this field that there would appear to lie the explanation of many of the variations of growth and development met with in everyday experience.

The Committee of Award of the Commonwealth Fund Fellowships has made a number of appointments to fellowships tenable by British graduates in American universities for the two years beginning September 1937. These fellowships are offered by the Commonwealth Fund of New York, of which Mr Edward S Harkness is president. Awards in medicine have been made to D M Douglas M B Ch B (of the University of St Andrews) to Minnesota University and to J D Spillane M B., B Ch of the University of Wales) to Columbia University

DOES SUPERFOETATION OCCUR?

REPORT OF A POSSIBLE CASE

BY

BRYAN C. MURLESS, M B Cantab, F R C S Ed
M C O G*Obstetric Registrar St Mary's Hospital*

AND

F L. McLAUGHLIN, M D,

Superfoetation may be defined as the implantation of a second fertilized ovum in a uterus which has already contained a pregnancy for one month or more. The possibility of such a phenomenon occurring in the human female is still a matter of controversy, and the following case report, although unfortunately scientifically incomplete, will be of interest in view of its extreme rarity.

Case Report

A woman aged 35 married for eight years gave the following amazing obstetrical history. In 1930 the year following her marriage, she was delivered of a stillborn child at thirty-two weeks. In 1931 she had another stillbirth this time at twenty-eight weeks. In 1932 she was delivered of stillborn twins and a further pair of twins were again stillborn in the following year. In 1934 a third pair of twins which did not live, were born at about twenty-eight weeks. She did not know the cause of death of any of these babies, but thinks that the first was trouble with the cord. She also believes that some of them were malformed. There was no family history of twins on either side. In the following year, 1935 she had a miscarriage following an accident at about sixteen weeks. On March 2, 1936, she had another miscarriage this time at about twelve weeks.

Following this miscarriage she had two small "shows" at intervals of a month, the first two months after her miscarriage. Apart from this, amenorrhoea existed from the miscarriage on March 2 to December 20 1936 when she gave birth to a normal live male child weighing just under six pounds. The delivery occurred under unusual circumstances. The patient received no ante-natal care and while motoring in the country experienced three very severe abdominal pains at intervals of one minute. Immediately afterwards the child was born in the car, the placenta following almost at once. The husband was the only witness of the delivery and the birth was promptly registered. No doctor attended her. The child survived and was bottle fed as the mother had no milk. The patient was little disturbed by the incident and was about again in twelve days time. During the three months following the birth she felt perfectly fit and well but noticed the abdomen remained rather large and was progressively swelling.

She was first seen by us on March 19 1937 exactly eighty-nine days after the delivery and said she thought she had developed a cyst. Amenorrhoea had existed since the child was born. No movements had been felt. On examination the breasts were active. The uterus contained a foetus with the vertex presenting in the right occipito-anterior position. The foetal heart was heard. The gestation period was estimated at thirty-four weeks and there was no apparent abnormality. The Wassermann reaction proved negative.

When told that she was pregnant she flatly refused to believe it, and partly to convince her a radiograph was taken. The radiologist confirmed the diagnosis and position of the foetus but estimated the period of gestation at thirty-six weeks. Even when shown the film she would not believe she had a normal pregnancy and was convinced she would produce a monstrosity of some type.

Three days later labour began with spontaneous rupture of the membranes. Progress was normal at first dilatation of the os being very rapid. After a two-hour second stage with weak pains delivery was terminated by a low forceps operation as a secondary uterine inertia was feared. While per-

forming the delivery it was noted that the soft tissues stretched very easily. A living female child was secured weighing 6 lb 12 oz and appearing perfectly normal and at full term. The third stage was completed within five minutes. Neither placenta nor membranes presented any abnormality but it was noted that the placenta was rather small measuring four inches in diameter and three-quarters of an inch in thickness. Bimanual examination fourteen days later revealed no clinical evidence of double uterus and the patient would not submit to lipiodol injection. Both mother and child made an uneventful recovery, milk appearing in the breasts normally on the third day. At the time of writing both her children are well and gaining weight rapidly.

Possible Explanations

There are three possible explanations for such a case. In the first place the delivery of a live child in December, 1936, may have been a product of the patient's imagination. Against this we have the husband's confirmation, the inspection of the child of the birth certificate, and of the form of registration by one of us (F L. McL.), and the rather fragile direct evidence of a small placenta and very easily dilatable maternal passages at the second delivery. On this and the knowledge that several similar cases are to be found in the older literature we feel convinced that the case is genuine. A second possibility is that the case is one of twin pregnancy with retarded development followed by delayed delivery of one of the foetuses due to diminished blood supply and difference in growth rate. The patient's tendency to twin pregnancies perhaps favours this explanation, but it seems hardly credible that the second twin remained for twelve months in the uterus to be delivered alive and apparently perfectly normal. Nearly all such cases end in early abortion. The third explanation is that this is a case of true superfoetation. This will explain the facts of the case, and the times at which we know coitus took place make possible the second fertilization some three months after the first.

Commentary

Theoretically fertilization of another ovum should be possible providing that the cavity of the uterus is not already closed by the developing ovum and that ovulation has continued during the pregnancy. As regards the first condition, we know that the uterine cavity normally becomes completely filled by the developing ovum between the third and fourth months, so that up to this time a second fertilization should be possible. The blockage of the cervix by a mucus plug and the sealing off of the Fallopian tubes by a decidual mucosa at this time have been cited as further objections. Actually the formation of a mucus plug is not by any means constant in the pregnant uterus, and if present it is not always an obstacle to the advance of sperm. The mucus plug has also been noted in the non-pregnant uterus, and it is possible that the ejection of semen from the male organ may be strong enough to pass it or wash it away. In addition cases in which the menstrual cycle continues during pregnancy indicate an open passage. A final point is that cases have been noted in which the orifices of the tubes were patent in the third month. One may presume, therefore that though the passage for sperm up the genital tract is closed in most cases of early pregnancy, there are occasional cases in which the passage remains patent up to about the third month.

It is generally believed that ovulation ceases during pregnancy under the inhibitory influence of the corpus luteum. There is evidence however, that in some cases ovulation does take place. Ravano (1907) examined the

ovaries of 100 pregnant women. He often observed ripening follicles and saw in no less than 5 per cent a recently ruptured corpus luteum. Studdiford (1936) examined the ovaries taken from 100 cases of ectopic gestation and concluded that though in some cases maturation of the ovum took place during pregnancy it usually terminated in degenerative changes and atresia. Moench (1927) reports a case of double uterus in which a miscarriage at twenty-eight weeks was followed three days later by the abortion of a twelve weeks foetus. Here ovulation must have continued or begun again about the fourth month. Radasch (1921) quoting Cosentino describes the case of a woman who died in the sixth month of pregnancy; the ovary showed a recent corpus luteum, maturing follicles were present in various stages of development, and one ruptured follicle was discovered which still contained a ripe ovum. It seems likely that, in an organ in which functional pathological changes are so commonly met with the inhibiting corpus luteum influence may occasionally be suppressed and ovulation occur. In cases of repeated abortion the influence of the corpus luteum is thought to wane between the third and fourth months. It is possible that ovulation can take place in these cases at this time, and that if the passage to the ovum is clear a second fertilization might ensue. It is interesting to note that the case we describe had two shows of blood at intervals of a month during the early gestation period.

Similar Cases

We cannot find any cases similar to the one we report in the recent literature, but several such cases are referred to by the older writers. The explanation may be that in modern obstetrics, in the normal course of events, the double pregnancy would always be recognized at the time of delivery and any delay of the second birth dealt with. Twins often vary in size and development and Schwaab (1920) describes a case of twins weighing 1,900 and 2,850 grammes. It is possible that such cases may be ascribed to superfoetation and if left to nature the smaller foetus might remain in the uterus till term. A similar case to ours is referred to by Milne (1871). This woman delivered a full term infant on November 17, 1807, a second infant, also at term was delivered on February 2, 1808. Churchill (1846) quotes the case of a woman delivered of a full term child on April 30. On September 17 she produced a second child, which also appeared to be at full term and both survived. That the uterus was single was confirmed at post mortem when this woman died in later years.

Other such cases are referred to by Leishman (1873), Barnes (1884), Cassan (1826) and Arrowsmith (1834). Bonnar in 1864, published a paper describing an investigation of the records of the British peerage, here the exact date of birth of successive children of peers is given without reasonable possibility of error. He has collected several examples of births rapidly succeeding each other which seem inexplicable by any theory other than superfoetation. He cites one case of a child born on September 12, 1849, to be followed by another on January 24, 1850, an interval of 127 days; both children survived. Such cases, he holds, are examples of superfoetation.

Other Evidence

A number of cases in which masses containing two foetuses of markedly different size and development were aborted are brought forward in support of the theory of superfoetation. In 1927 Riddell reported a case diagnosed as a missed abortion. At operation a three and a half-

months macerated foetus and placenta were discovered, together with a healthy growing foetus of seven weeks. He suggests that in this case ovulation may have begun again after the death of the larger foetus. Willis (1929) cites a case in which two foetuses estimated as being of nine and sixteen weeks gestation respectively, were aborted. A single placental mass with two cords issuing from it excluded the possibility of a double uterus. Hansen (1932) reports a similar case, in which he estimates the gestation periods at one and three months, both foetuses were quite normal and appeared only recently dead. Other such cases are reported by Langmore (1863), Tyler Smith (1856), Gustetter (1918), Föderl (1932), Studdiford (1936), Radasch (1921), and others. In the case Radasch describes an aborted mass contained two foetuses of sixteen weeks and forty days' estimated gestation in separate sacs. Neither showed any signs of maceration. He points out that the younger a foetus is the more rapidly does maceration take place, and he feels that his is a case of superfoetation, as a young foetus could not remain dead in the uterus for two months without showing marked maceration.

Superfoetation in Animals

There is much convincing evidence that superfoetation can take place in animals, though here also it must be regarded as an extremely rare event. Slonaker (1934) has produced perhaps the strongest evidence in its favour in his work with albino rats. These animals show periods of activity and alterations in the vaginal smear corresponding with ovulation. During pregnancy, which lasts twenty-two days, these characteristic signs of ovulation are absent, but in a few animals he observed periods of activity occurring between twelve and fifteen days after coitus. In these cases he presumed that ovulation was occurring during pregnancy, and accordingly left two such animals with the male till the twentieth day after the first coitus. Both animals gave birth to two normal litters, the first on the twenty-second, followed by a second litter on the thirty-seventh day after the first coitus. He feels sure that both were cases of true superfoetation. Numerous other examples of superfoetation in animals are reported. Buchanan Smith (1927) observed superfoetation in large black sows, in cases which he concludes cannot be explained by arrested development. He also cites cases occurring in sheep. Markee and Hinsey (1935) report a probable case in a cat. Other instances are cited by King (1913), who has also observed cases in albino rats.

Conclusion

We have described a case of which we think the most likely explanation is superfoetation. Unfortunately there was no scientific proof and no medical witness of the first birth, but from our observations we are both convinced that the case is a genuine one. A number of similar cases are described in the older literature but none in recent years. Thus we attribute to the fact that in modern times comparatively few cases escape the attention of doctor or midwife.

An outline of some of the literature is given, showing evidence that ovulation may occur during pregnancy, that cases of abortions containing foetuses differing widely in size and development are seen from time to time, that cases are reported in animals.

Lastly it should be remembered that since all possible circumstances are against superfoetation occurring, it is extremely rare, but there is an exception to every rule, and just because it has not occurred, or rather has not

been reported previous to a certain time, does not mean it can never occur, and it is only fair for those who would be dogmatic to consider such a case as this with an open mind

KERATOPLASTY

BY

R. E. WRIGHT, C.I.E., M.D., LICUT-COLONEL I.M.S.
 Professor of Ophthalmology, Medical College Madras

During the last few years much attention has been drawn to corneal grafting by numerous publications in ophthalmological and other journals. The experimental work of Tudor Thomas in England and Castroviejo in America has illuminated the subject considerably, but has perhaps tended on the whole to emphasize the difficulties of the procedure in the minds of medical men. The demand for the relief afforded by keratoplasty is relatively small in Western countries, and this, together with the comparative scarcity of good material for transplants, limits the field and tends to make the majority of ophthalmic surgeons in the West hesitate to adopt a measure which presents so many apparent difficulties.

Conditions are different in the Near and Far East, where the demand for relief by corneal grafting is considerable and suitable grafting material is easy to obtain. Under such circumstances it is only to be expected that simplification of technique and greater rapidity of execution should be aimed at and acquired, and although reports of cases and operative detail from Eastern Europe, India and adjoining areas do not show up prominently in the literature, there is little doubt that in these areas much more practical experience has been obtained in performing corneal grafting on the human subject than elsewhere.

A Simple Technique

I am not familiar with the exact methods adopted by the various ophthalmic surgeons who freely employ keratoplasty in the East but I have evolved a simple technique which appears to hold out as good a chance of success as the more elaborate methods described in recent literature. It has the advantage that it can be undertaken confidently by any ophthalmic surgeon of experience. I demonstrated this method in Melbourne at the Annual Meeting of the British Medical Association but only on the rabbit, as a patient and donor were not available.

The trephine is used for both graft and bed. The nests of trephines made for me by Messrs Down Brothers give a fair range in size. Although I have employed a 12-mm trephine on two occasions my impression is that this is too big not because the graft does not readily take, but because anterior synechiae are more likely to occur. The formation of an anterior synechia with the back of the graft junction is the complication most to be dreaded in keratoplasty. A 3 mm trephine is too small except when one employs it for the graft method of treating fistula which I have described. The best average trephine diameter is perhaps 6 mm. There is no real need to have special nests of trephines, although the finish of the edge in specially made cylinders gives a bevel to the margin of graft and trephine hole. Cork borers such as are found in a laboratory, are almost equally good. No other special instrument is required, although of course it is preferable to use fine needles, such as Barraquers or Kalt's half circle 7 mm point to eye (maker's 12 mm), and a delicate needle holder such as that made for me by Weiss. The various steps in the procedure are briefly as follows.

The cornea chosen for grafting should preferably have a normal anterior chamber. (This is highly advisable in earlier attempts. Later the surgeon may consider what we refer to as reconditioning the anterior chamber before grafting a much more difficult and tedious procedure.) The graft should for preference be obtained from a living human eye. I have no experience of grafts obtained post mortem. Eyes blind from glaucoma furnish quite good grafts, as do eyes removed in the course of exenteration for malignant disease. It appears to be unnecessary to choose a donor of the correct blood group. The donor and recipient are placed on adjoining tables and prepared in the usual way as regards surgical cleanliness. Alkinesia and anaesthesia are established by novocain and adrenaline, pantocaine drops are given. The recipient's pupil should be small, the donor's wide, if this is possible. The necessary instruments for completing the enucleation or exenteration on the donor are left ready and an operator detailed for this work.

Preparation for Transplantation

Having decided on the disk diameter and the trephine to be used, the site is demarcated on the recipient's leucomatous cornea by a few rotations of the trephine. The stitches are then put in, taking the first bite at 6 o'clock just off the cornea where an easy but firm grip can be taken with the point of suture which does not produce conjunctival drag or puckering. One end of the thread is held, the needle with the other is carried across the cornea to 12 o'clock where a similar bite is taken. The needle is then unloaded and the free end carried back to 6 o'clock and laid beside the end already in position. This manoeuvre is repeated at points corresponding to 7.30 and 1.30, 9.30 and 4.30. It is well to do this clockwise and remember the order of placing the sutures. One observes how they will eventually be related to the graft by noting where they cross the demarcated area. The stitches are then pulled free of the demarcated area, the lids closed, and attention given to the donor who now has a speculum *in situ* and is ready prepared.

Trephining the Donor

Here the same trephine is used in a corresponding position on the cornea. Good fixation of the globe is desirable. This can be effected simply by a T shaped fixation forceps. The trephine must be used evenly and freely.

KERATOPLASTY

It is desirable to go right through and get the disk cut away clean as far as possible. There is generally a hinge left the shorter this is the better. On removing the trephine the disk opens outwards on its hinge, pushed by the contents of the globe. One should try to avoid damaging the uvea and getting pigment on the graft. If the graft tilts the hinge is easily cut free on the bevel with fine sharp scissors either fine blunt-pointed or curved with one sharp and one beaded point. A fine Stevens type of scissors answers satisfactorily.

If the trephining has been well done the hinge consists of a narrow belt of Descemet's membrane which is readily cut free. The graft must on no account be touched at this stage except with a camel hair brush or an equally innocuous piece of apparatus and then only on the epithelial aspect. Should the hinge be larger and the graft remain *in situ* it is perhaps best to complete the separation of the hinge with a narrow Graefe's knife. The knife is plunged through the gap already cut, deep into the eye regardless of the lens, which is dislocated backwards if necessary. The edge is then approximated to the hinge which is cut on the bevel as the knife is withdrawn. This is repeated. Cutting in the other direction is more dangerous to the graft, and Descemet's membrane is more likely to be rucked up. The severed disk is now received—epithelium downwards—on a Volkmann spoon encouraged by a camel hair brush. It is submerged in saline—or more elaborate physiological isotonic solution—about body heat. Should vitreous or pigment appear to be adherent to the endothelial face it is gently removed with the brush from the centre towards the periphery. The graft is treated from the beginning like a delicate histological section in process of mounting. The donor is then left to another surgeon and the process of trephining the recipient commenced.

Trephining the Recipient

Here one must proceed with great caution. With even rotation trephine as far through the cornea as possible, it is generally fairly obvious when one is nearly through. A slight tilt is then given to the trephine, which goes through followed by an aqueous escape. In this case the hinge is likely to be much larger possibly two thirds the circumference of the circle. Fortunately one can seize the disk in a forceps and deliberately sever the hinge slowly and carefully with a suitable bevel by means of the knife or scissors, such as mentioned above. The chamber is now inspected. Let us assume the pupil is contracted the iris intact and the lens clear. This is the ideal background. A little normal saline is run in from the irrigator. This temporarily gives a view towards the angle and leaves a little fluid between iris and cornea.

The Transplantation

The graft is now lifted with the Volkmann spoon and camel hair brush from its warm saline tumbled into the aperture and adjusted to its new position by a few touches of the brush. The stitches are then replaced over it in their order and tied off by means of a pair of forceps suitable for this purpose. Suture tying forceps are most desirable at this stage and Silcock's iris forceps are more useful for this than the purpose for which they were originally intended. Atropine and iodoform ointment is now placed in the conjunctival sac the eye closed, and both eyes bandaged. The patient is kept somewhat quieter than a cataract case gently examined on the third day and a little more atropine and iodoform ointment given. The graft has usually taken by this time and the

chamber formed. On the fifth day the stitches are removed. Atropine is continued. The patient is allowed to walk to inspection, and goggles are given on the eighth day.

Points of General Interest

It is undesirable here to go into all the variations that may have to be adopted if the condition of the recipient's eye is other than that suggested above—for instance, in leucoma adherens with shallow or non-existent anterior chamber and the whole grout of abnormal conditions in the anterior segment which follow gross corneal ulcers. The procedure of preliminary investigation and preparation naturally varies in every case, but its detailed discussion is more suited to a thesis on corneal plastic methods. There are a few points of general interest and practical importance which may be noted here.

A cornea that has previously been vascularized—for example, one which has been affected by interstitial keratitis or trachomatous pannus—offers better soil for a graft than a cornea free of such old vessels. This has been known for a long time, and is referred to by Elschnig.

A child is a much more difficult subject for keratoplasty than an adult.

It is important to respect Descemet's membrane; it readily lifts, buckles and detaches at the cut edge.

Anterior synechiae are liable to form in this situation. These are almost certain to be followed by opacification of the graft unless very trivial and freed early. The use of eserine is preferable to that of atropine in the grafted eye if the graft is large. Atropine may be desirable if the graft is small, this requires judgement. The main object is to avoid anterior synechiae.

The stitches must not be left too long, they may damage the graft. Five days is quite long enough. An optimum result with a clear graft and really good visual acuity is exceptional. Improvement to the extent of allowing a previously "led" patient to see large objects and get about alone is a modest expectation in straight forward cases. Patients must be warned not to expect too much, this saves disappointment. The most theatrical effects are produced by successful keratoplasty when the blind patient is made to see, but this is by no means the only indication for corneal grafting. As a method of repair it is often far superior to the conjunctival flap, the epithelial graft, and such plastic procedures.

Sir E. John Russell, F.R.S., of the Rothamsted Institute, Harpenden is to lead a group of members and friends of the Le Play Society to Russia in August. The visit will afford an opportunity for seeing something of what is being done in the application of science to everyday problems in Russia particularly in regard to farming. The general geographical features of the country, its geology, vegetation, and various social experiments will also be studied. This group will leave London on August 6, travelling via the Black Sea to Erivan in Soviet Armenia, returning via Moscow and Leningrad by boat to London. Finnish Lapland is to be visited by another Le Play group, who will stay for a short time on the Arctic coast. For geographers botanists, and geologists this presents a particularly interesting area for vacation study. The party will leave London on August 4. Similar arrangements are being made for visits to Yugoslavia (Old Serbia) where there will be special interests for the geologist and the botanist to Czechoslovakia, to the Dalmatian coast, and to the Outer Hebrides. Full details of these vacation visits can be had from Miss Margaret Tatton, director, the Le Play Society, 58, Gordon Square, London, W.C.1

SYPHILIS IN THE DIAGNOSIS AND PROGNOSIS OF CANCER

BY

J I MUNRO BLACK, M.S., F.R.C.S.

*Junior Assistant Pathologist late Assistant Radium Officer
Junior Surgical Registrar Royal Victoria Infirmary
Newcastle upon-Tyne*

The association of syphilis and cancer has long been appreciated as one of some closeness, and much work has been done on the subject and interesting results obtained from its study. Most of this has centred upon syphilis as an aetiological factor, and is, of course, of great importance in the appreciation of pre-cancerous conditions. The practical application, however, of this work must lie with the authorities concerned in the control of venereal disease, and with those who have to treat syphilis. From the point of view of the surgeon dealing with a cancerous patient it may be of great philosophical interest to know that a history of syphilis is present, and of course if the disease is still active the patient should be handed over to the proper person for full anti-syphilitic treatment later. This paper is concerned, however, not with pre-existing syphilis and cancer, but with the danger of coexisting syphilis giving rise to difficulties in the diagnosis of cancer, and perhaps modifying the prognosis by causing delay in treatment.

The universality of syphilis, especially in the days not long past, and the multiplicity of the lesions in its later stages, has given it the place of honour as the producer of any unusual condition. In consequence one finds a tendency to think of syphilis when confronted with any curious lump or ulcer. For the older generation of surgeons it may have been common to find the lesions of tertiary syphilis but to a younger generation they are of comparative rarity, and it is the fostering of this newer outlook, especially with regard to the diagnosis of cancer that I wish to encourage. If a gummatous lesion is not diagnosed it may be very gratifying for someone more experienced to point out the obvious nature of the lesion and the ease of its cure, but no great harm will be done by any delay incurred.

Two Illustrative Cases

An outstanding example comes to mind in the case of a young man, aged 21, who was seen in October 1934, with a swelling in the right temporal region of four months duration.

The swelling had appeared originally with a little pain a week after a local injury since when it had steadily increased in size with slight variation. The swelling was diffuse a little tender and rather boggy. It was incised but no pus was obtained and a radiograph did not show any changes in the underlying bone or other abnormality. The patient returned two months later with the mass increased in size and it was treated with interstitial radium. This had no effect and a month later the mass was excised and was shown by histological examination to be a gumma. With this knowledge a Wassermann reaction was carried out and proved to be positive.

Indeed a sorry tale, all of which could have been obviated by a biopsy at the very beginning but the great fact remains that the man is alive and has now had a full course of anti-syphilitic treatment.

A man aged 26 was sent to hospital with a diagnosis of carcinoma of the tongue confirmed by biopsy and with a negative Wassermann. The lesion however did not look neoplastic and a further biopsy was performed which was

reported as probably gummatous in spite of the negative Wassermann. This reaction was repeated and proved positive and the patient was given potassium iodide. Rapid improvement resulted and was followed by a full course of proper anti-syphilitic treatment. In this case the true diagnosis was arrived at first by experienced clinical observation but ultimately by the opinion of a good histologist.

On the other hand, if a cancerous lesion is treated as syphilitic, then the real diagnosis will probably only be evidenced by the appearance of metastases, by which time the outlook is very gloomy. Many patients are unfortunate enough to suffer from cancer and have serological evidence of syphilis. In their cases either a false diagnosis is made or doubt left owing to the positive Wassermann reaction, and valuable time may be lost while potassium iodide is given, or even a full course of anti-syphilitic treatment.

Diagnostic Difficulties in Oral and Pharyngeal Cancer

It has been found that the difficulties of diagnosis seem particularly great in oral and pharyngeal cancer or in associated neck glands, and it is with special reference to such cases that I write, although I believe my remarks have a very general import. In the first place, cases are seen in which the diagnosis of the lesion has been uncertain, and the practitioner has fallen back on syphilis or cancer as possible causal agents. It is very easy to take blood for a Wassermann reaction, and if this should happen to be positive—and there is a greater possibility of such being the case in a cancer patient—then potassium iodide will probably be given. Now it is well known that malignant lesions, especially those of the mouth, do show evidence—though, of course only temporary—improvement under potassium iodide so that it is possible that the combined influence of a positive Wassermann and improvement under potassium iodide might lead to a full course of anti-syphilitic treatment being started. This is perhaps a good programme for the treatment of a gumma, granting that to a surgeon familiar with the manifestations of tertiary syphilis the lesion would probably have been obvious in the first place. Owing to more efficient control and early treatment of syphilis such lesions and such surgeons are becoming rare. If, however, the lesion be not syphilitic, but cancerous a tragedy will be well on its way to occurring. Such a danger is very real and is brought forcibly to notice when one sees how closely a cancer can at times mimic a gumma.

A case in point was that of a male aged 54 who was seen in June 1936 with an ulcer in the middle line of the middle third of the dorsum of his tongue about 3 cm. in diameter. The base was formed by a yellowish sloughing mass but the edge was slightly raised and hard. There was no fixation of the tongue and no enlarged neck glands were present. The surrounding tongue and palate were leukoplakic. The ulcer had begun as a little lump six weeks previously and had not caused any pain. A tentative diagnosis of gumma had been made and many who saw the case agreed that this was correct. Owing however to the suspicious nature of the edge a biopsy was asked for and at the same time a Wassermann reaction was carried out—and incidentally reported as positive. The histological examination revealed a non-keratinizing squamous carcinoma. Radium treatment was started and later a block dissection of the neck was performed.

In such a rapidly growing tumour the outlook could not be good and the patient has now a recurrence in his neck but any delay which would surely have occurred in the absence of a biopsy, would have made things very much worse.

The Question of Biopsy

It is better to be ever thinking of cancer at the outset, and to make the diagnosis by biopsy if there is doubt. Should there then be a suspicion of syphilis, the question of cancer having been ruled out, let a Wassermann reaction be confirmatory only and hand the patient over to the proper person for full treatment. An objection to this line of investigation is the danger of the biopsy enhancing the possibility of metastasis. Personally I have not seen or heard of any damage resulting, but in view of other better qualified opinions I must acknowledge the possibility. Perhaps the diathermy needle helps to minimize this risk and in dealing with the more malignant anaplastic carcinomata and sarcomata, in which the danger is supposedly much greater, a dose of γ rays might be given immediately before or after the biopsy. The extreme importance of early accurate diagnosis is, however, so great that some risk is justifiable. We are left with the possibility in the highly malignant cases of using irradiation as a means of diagnosis as well as treatment should a biopsy really be contraindicated. A rapid resolution will suggest the continuance to a full course of treatment; no response will demand a diagnosis.

A second type of case occurs in which the lesion is or should be recognizable as a cancer, but the patient is found to have a positive Wassermann reaction. In many clinics such an investigation is carried out as a routine on all possible cancer cases. In the past this was of importance for completeness of records or for statistics, which I venture to suggest have now proved the aetiological relationship of the two conditions. When done in a cancer clinic or under the auspices of one who sees many cancer cases and who is accordingly ever on the look out for neoplasms little harm can occur, but if done under less favourable circumstances there may be a tendency to treat the syphilis first and see what happens to the suspect lesion. In such an event I am of the opinion that really valuable time is lost. The cancer must be treated first; after all, it does not take long, and then the patient can be handed over for full and proper anti-syphilitic treatment. Remembering that there is real danger of a coincidental positive Wassermann reaction throwing doubt upon the diagnosis of a cancerous lesion, one wonders whether anything is gained by its routine performance in this type of case. This is really of vital importance because we are dependent for better results upon earlier diagnosis and this earlier diagnosis is going to be made, not by cancer experts, but by the general practitioners, who must at all costs play for safety and think of cancer first. It is not suggested that the general practitioners should themselves perform a biopsy upon all doubtful lesions because a surgeon of greater experience may be confident of the diagnosis on clinical grounds. But if after consultation some doubt remains, then biopsy must be urged and should be performed by one who is in close co-operation with a pathologist.

A final possibility is that in leaving the syphilis untreated during the treatment of the cancer the prognosis may be worsened, but I do not know of any evidence to this effect and do not see any real reason why anti-syphilitic treatment should not be started immediately in any case. That however is not a question for the surgeon or radiologist who is dealing with the cancer, but for the venereologists and I maintain that the cancer has the prior claim to treatment.

Clinical Memoranda

The Aetiology of Femoral Hernia

When operating recently on a man of 59 for strangulated femoral hernia I found a condition that interested me in the light of the theories of origin.

CASE REPORT

This particular hernia had existed for thirteen or fourteen years; its development had been gradual, and up to the time of the patient's present illness it had been reducible. The onset of pain was sudden with vomiting. I saw him about three hours later. Efforts at reduction failed and operation was undertaken. Incision over the tumour showed an engorged purple mass, having a superficial resemblance to bowel; it proved however, to consist of lobules of fat. It was followed up to a narrow neck, constricted as usual by the sharp edge of Gimbernat's ligament. After prolonged dissection the sac was discovered and opened inside the strangulated mass and was quite empty. The tumour consisted of extraperitoneal fat on the outer surface of an empty hernial sac. (It is of interest that, when exposing the external abdominal ring in the course of operation, a lobule of extraperitoneal fat projected here also and was sliding freely up and down the inguinal canal.) The sac was tied off in the femoral canal, the stump drawn up above Poupart's ligament and stitched to the external limb of the conjoined tendon; the canal was then closed by suture through conjoined tendon, Cooper's ligament, and external oblique at the same time bringing the medial wall of the internal abdominal ring beneath the cord into apposition with the upper and internal surface of the external oblique, as for Bassini's closure.

COMMENTARY

I record this case as it seems to support J. Philip Buckley's (1934) 'acquired sacular' theory of origin, by which, as he supposes, extraperitoneal fat protrudes through the femoral ring, expands in the loose tissues of the thigh, and draws down further lobules and eventually a small pouch of attached peritoneum. A time comes when the expanded fatty mass is unable to return through the narrow neck. It would seem obvious that in my patient at any rate this had been the course of events. R. Hamilton Russell (1923) asserts that femoral sacs are invariably congenital, acquiring contents at varying periods of life, and that removal of the sac is therefore the only treatment necessary. In cases such as mine, where the sac appeared to be an unimportant adjunct to a mass of extraperitoneal fat, it seems doubtful if this treatment would be adequate. The theory also fails to explain how recurrent femoral hernias occur after operation and removal of the sac. Leslie W. Tasche (1932), on the other hand, finds that these sacs are never congenital. There is at least no record of their discovery in a foetus or a newborn infant. He also holds that traction rather than pressure is the primary cause of the hernia, rejecting Murray's theory of abnormal gubernacular pull, for which there seems very little evidence, and believing that the primary escape is of a fat lobule, a sac and its possible contents being drawn down subsequently.

When one comes to consider treatment, it seems at least doubtful whether removal of the sac, without any further precautions, would in the case here recorded have been an adequate safeguard against recurrence or redevelopment.

Reviews

FACIAL PAIN AND FACIAL SPASM

The Facial Neuralgias By Wilfred Harris M.D. F.R.C.P. (Pp 109 15 figures 7s 6d net) London H. Milford Oxford University Press 1937

Les Spasmes de la Face et leur Traitement By Th. Alajouanine and R. Thurel (Pp 88 12 fr) Paris Masson et Cie 1936

Dr Wilfred Harris's well-known book on *Neuritis and Neuralgia* is a mine of clinical information about pain in all parts of the body. His new book, *The Facial Neuralgias*, is a further attempt at classification and differential diagnosis of the many and baffling types of facial pain. Naturally trigeminal tic, in the treatment of which by alcoholic injection Dr Harris has been one of the pioneers, bulks large in this new volume, about half of which is devoted to this subject. Dr Harris, besides reviewing the aetiology and clinical features of trigeminal neuralgia, discusses the indications for both alcoholic injection and surgical treatment, and describes the technique of the various routes of injection and the after-care of the patient in detail. He pays special attention to migrainous neuralgia, the recognition of which as a clinical entity is due mainly to his own observation and which he has treated successfully by alcoholic injection. He also describes the rarer forms of facial neuralgia, such as geniculate and glossopharyngeal neuralgia, and draws attention to the important but as yet incompletely explored field of pain of sympathetic origin. Since the book also includes such common causes of facial pain as disease of the teeth and nasal sinuses, it is a very complete review of the subject. The older clinical knowledge is combined with an exposition of recent advances in diagnosis and treatment, and the whole is diversified with brief reports of cases and amusing experiences. As a study in diagnosis it will appeal to a large medical public, though when it comes to the application of the technique of alcohol injection of which Dr Harris is himself a master many will be found to sympathize with the neurosurgeon quoted by Dr Harris as saying that when he injected the Gasserian ganglion there were two terrified people one at each end of the needle. The production of the book attains the high standard expected of Oxford Medical Publications.

In *Les Spasmes de la Face et leur Traitement* Drs Th. Alajouanine and R. Thurel discuss the differential diagnosis and treatment of various forms of involuntary movement confined to or predominating in the face. Under the term peripheral facial hemispasm they describe the spasmodic muscular contractions often seen after facial paralysis and the myoclonic movements which they term *hémispasme facial autonome* but which are usually known in this country as facial myoclonia. The treatment advocated for the latter condition is the injection of the facial nerve beneath the zygoma with 70 per cent alcohol. Under the term facial spasms of central origin the authors include facial tic, facial Jacksonian epilepsy, chorea athetosis and blepharospasm which they regard as being of organic origin. For blepharospasm they recommend bilateral alcoholic injection of the superior branch of the facial nerve. This little monograph concludes with a bibliography of seventy-four references.

PRACTICAL ORTHOPTICS

Practical Orthoptics in the Treatment of Squint By Keith Lyle M.A. M.D., M.Chir. M.R.C.P., F.R.C.S., and Sylvia Jackson (Pp 212 64 figures, 5 plates (4 coloured) 12s 6d net) London H. K. Lewis and Co 1937

The work of the "Orthoptic Clinic" of the Royal Westminster Ophthalmic Hospital is the theme of this book by Mr Keith Lyle and Miss Sylvia Jackson. The clinic was started by Miss M. C. Maddox, daughter of Dr E. E. Maddox of Maddox rod fame. The authors of the book give a clear and yet detailed account of the methods of fusion training, and have set themselves to show which particular types of squint benefit by training and those in which such treatment is merely a waste of time. They rightly insist that such training is not to be regarded as a substitute for the correction of refractive errors, nor for operation, although in a large proportion of cases orthoptic treatment may cure a squint without recourse to operative adjustment.

The authors emphasize the point that this branch of work must be carried out by those who have a special knowledge of the subject, real harm may be done otherwise. To protect patients an Orthoptic Board has been formed regulating the training and qualifications of orthoptists. Candidates for the qualification must be of school certificate or matriculation standard of education, and must study for one year in the orthoptic centre of one of the hospitals recognized by the board at the end of which time they are required to satisfy the board's examiners as to their efficiency.

CHEMISTRY, ORGANIC AND INORGANIC

Essential Principles of Organic Chemistry By Charles S. Gibson O.B.E. M.A. Sc.D. F.R.S. (Pp 548 18s net) London Cambridge University Press 1936

Inorganic Chemistry. A Survey of Modern Developments By Sir Gilbert T. Morgan D.Sc. Sc.D., LL.D. F.R.S., F.I.C. A.R.C.Sc. and Francis Hereward Burstall M.Sc. A.I.C. (Pp 462. 15s net) Cambridge W. Heffer and Sons 1936

Gibson's *Organic Chemistry* is written more especially for the particular class of students who are later to engage in biochemistry, pharmacology, and kindred sciences. Among the textbooks of organic chemistry in modern use there are some which are so much alike that any of them could be exchanged for another without gain or loss. This work differs from many others in that it bears the impress of the author's individuality. This is a commendable feature, and when the author knows the special ramifications of his subject which are of peculiar interest to his own class of students, and when, moreover, he has a gift for the presentation of facts in a clear and connected form the teaching cannot fail to carry with it the teacher's spirit of enthusiasm. By this quality in a textbook the student's work is rendered easier and more profitable. Gibson's book fulfils this characteristic. It is replete with the information needed by those students for whom it is intended arranged in sequence to form a coherent system and explained in the clearest language. The omission of those branches of organic chemistry which are not pertinent to the intended course of study, an omission highly necessary in this case, has been effected with a nice regard to the length of pursuit of the less relevant branches and the point of their interruption. The omission of the terpenes and certain other sections has permitted a useful expansion of more important matters.

Morgan and Burstall's *Inorganic Chemistry* is a general treatise embodying the more important discoveries.

recent times. The subject is approached from the modern point of view regarding the interatomic relationships comprised in the terms electro-valency, covalency, and co-ordination linking. After an introductory chapter illustrating the meaning of these terms there follows a series of chapters one allotted to each of the periodic groups of elements. Other chapters deal with subjects chosen for their special interest, such as the corrosion of metals, compounds of metals with other metals, and the metallic carbonyls. The nature of the subject matter is diversified and embraces all kinds of material in many different aspects. It would amaze chemists of an older school to read of varieties of gaseous hydrogen designated as para and ortho. Is there a dearth of inventive genius among chemists in the matter of nomenclature? The terms para and ortho were already much overworked. Also the utilitarian school will eagerly learn of the use of helium in diving apparatus, helium having less solubility than nitrogen does not give rise to the release of bubbles in the blood during decompression of the diver's atmosphere. The method of treatment of the subject is directed to an explanation of the properties of the elements and their compounds on the lines of the most modern theories, and much valuable information is given regarding the uses that are being made, both in science and in the arts, of the knowledge founded on the newly discovered properties of elements and their compounds. Precise details are in general omitted but references to original papers supply pointers for a more complete study of the matters discussed.

ORTHOPAEDIC HISTORY

Source Book of Orthopaedics. By Edgar M. Bick, M.A., M.D. (Pp. 376, 18s.) Baltimore: Williams and Wilkins Co. London: Baillière Tindall and Cox, 1937.

It is always melancholy to contemplate waste of human effort. If it is a matter of books one may find an author who is still busily writing about a lost or dead cause, or one who has obviously been at great pains to collect good material and then has not known what to do with it. Dr Edgar M. Bick, the author of a *Source Book of Orthopaedics* comes into the latter category. He must have read hundreds of papers, and he has undoubtedly got together a mass of valuable information. But it is presented so baldly. Baedeker's style is superb in a condensed guide book but it is not suited for a historical work. Here are two typical passages for comparison.

The E window is by Burne-Jones. On the N side are a series of interesting monuments. Sir George Nowers (d. 1425) and Lady Montague (d. 1353) with fine effigies. The Prior's Tomb (ca. 1300) and the so-called Shrine of St. Frideswide (15th or 16th cent.) more probably a watching-chamber. On the pier at the foot of the monument of Sir George Nowers is the tablet of Robert Burton (d. 1639).

In Germany the method gained rapid acceptance. Vulpius,¹⁷ and Holmeier¹⁸ in 1888, Peterson¹⁹ in 1889, Schussler²⁰ in 1890 and Dollinger²¹ in 1891 all reported cases in which this procedure had been attempted with varying degrees of success. Giordano²² in 1890 and Bidone²³ in 1894 were among its early advocates in Italy.

True paragraphs of this kind are separated by patches of discussion or narrative, but they turn up with depressing regularity. What is needed is a story of movements in this fascinating history of orthopaedics, the slow evolution of principles, accounts of the work of the great pioneers—perhaps with the detailed references as footnotes or an appendix. But it may be that this is not what a 'source book' should do.

The author's style is not calculated to attract the reader, we find it uneasy and heavy. And there are shocks all

along the way: coupe for coup, capitis femoris for head of the femur (nominative), phlange (not in the Oxford Dictionary) for flange, diversified meaning different, and Waterloo fought in 1814. Nor does there seem to be any clear idea as to when medical history ends. According to Dr Bick, it includes work being carried on at the present time, good work perhaps, but not yet of proven value. Yet with all these faults the book is valuable, though painfully difficult to read. An astonishing amount of useful information has been collected, and this alone justifies recommendation of the book as a work of reference. We hope that a second edition will soon be called for, and that the opportunity will be taken for drastic revision on more rational and more historical lines. We hope that the author will not be offended if we advise him to study again Keith's *Menders of the Maimed*.

COMPONENTS OF HUMAN TEMPERAMENT

When Temperaments Clash: A Study of the Components of Human Temperament. By Murdo Mackenzie, M.D. M.R.C.P. (Pp. 227, 7s. 6d. net.) London: T. Murby and Co., 1937.

The mediocre performance which most of us put up in this complicated and bustling modern world is largely the product of a harried nervous system. If we knew how to protect our nerves from the powerful discordant stimuli they are always receiving we should be able to keep calm, hold ourselves together, maintain our balance, and time our efforts—whether at golf, investments, or human relationships—so that they would be effective. Dr Mackenzie, whose name is already well known to readers of this *Journal*, sees civilized men placed between the two enemies of anxiety and apathy, and thrown willy nilly from one to the other. Man has gained a great deal of power over the unimaginative world, but is still a child in his dealings with the imaginative world. He can control and annihilate animals, but cannot find the proper way to live with his fellows. The result is a conflict, varying in degree but practically constant which throws both tyrant and victim into a state of nervous disequilibrium or neurotic instability. Dr Mackenzie describes this state and its many symptoms in vigorous ordinary language, full of commonplace instances. His analysis of anxiety and apathy in the life of an ordinary business man who lives between his office and his suburban house will bring home for the first time to many medical and more lay persons the real nature of neurosis. He then does what few writers on neurosis do: he suggests a solution, and sketches its working out in the life of a craftsman, an advertiser, a dealer, and an administrator. In his last chapter he gives valuable hints on the means by which a patient can obtain temperamental release by learning to work along the line of his own temperamental pace and sense of value. Even with a bad start, the author holds, the gift hitherto concealed can with knowledge, courage, and sincerity be changed into the gift released.

COSMETIC DERMATOLOGY

Cosmetic Dermatology. By Herman Goodman, B.S., M.D. (Pp. 391, 36s.) London: McGraw-Hill Publishing Co., 1936.

We have often called attention to the fact that the cosmetic applications of dermatology are much neglected in this country. Such is not the case in America. Dr Herman Goodman, who has long devoted himself to the cosmetic aspect of cutaneous disease, has now produced a valuable treatise which includes much information that will be found very useful not only by medical practitioners

interested in skin disease, but, in particular, by that large class of people who in the United States appear to be known as 'beauticians'. The book is divided into two parts: the first consists of a dictionary of ingredients employed in cosmetic prescriptions, while the second part comprises a number of chapters on the many cutaneous diseases that are of cosmetic importance and also on miscellaneous matters such as lipsticks, face powders, cold creams, pigmentation of the skin, etc.

One of the most valuable features of Dr Goodman's book is the immense collection of cosmetic prescriptions he has gathered together, each of which he claims to have tested personally. One wise conclusion we heartily endorse: every physician should know what his prescription looks like when it makes its appearance as a lotion or an ointment. This is a point often neglected in the instruction of students. The formula is written out, the patient is sent off with it to the hospital dispensary, but the actual completed preparation is never seen by the physician or his class. Naturally in cosmetic therapeutics the elegance of the finished product is of more importance than in other branches of dermatology, but in none of them should it be neglected. Specimens of ointments and lotions commonly used might well be kept in the out-patient department so that students may become familiar with the outcome of their own prescriptions.

Although the volume before us will undoubtedly be of use to dermatologists, we can recommend it still more strongly to the professional 'beautician', who will find in it preparations suitable for every cosmetic purpose, and also much good advice which should prevent him from undertaking the responsibility for treating conditions that ought to be entrusted to a physician. Altogether a somewhat unconventional but nevertheless valuable work.

Notes on Books

The fifteenth edition of Warwick and Tunstall's *First Aid to the Injured and Sick* (Bristol: J. Wright and Son, 2s. 6d.) which has been edited by Dr F. C. NICHOLS, is described as an advanced ambulance handbook and is such as of great value. The chief alteration in the present edition is the greatly increased space given to the chapter on gas poisoning in warfare. This subject is receiving intensive study by the St John Ambulance Brigade which is training its officers and men in anti-gas precautions and the treatment of casualties. A new section on inflammation and sepsis aims at giving the first aid student a clearer idea of what these conditions mean and how they should be dealt with. The glossary has been doubled in size and various minor changes have been made in the text.

Le Métabolisme de l'Azote: les Problèmes Biologiques by Professor F. F. TERROINE of Strasbourg is No. 20 of the series of monographs which are being published by the University Presses of France (80 fr.). The author dealt with another section of nitrogenous metabolism in a previous monograph. He now takes up the digestion of protein under four heads: the utilization of proteins; the nature of the materials absorbed; the processes of digestion and absorption; and the mode of action of the digestive ferments. The author gives a detailed and critical account of his subject and a special feature of the monograph is the wide range of sources from which he has obtained his information. In addition to clinical and laboratory evidence he also has made use of information derived from work feeding and consequently gives an exceptionally full review of protein digestion in animals. The section on enzymes deserves no notice because the author

has done much to minimize confusion by distinguishing clearly between results obtained from the study of digestive juices and those obtained by the maceration of gland tissue. In his treatment of the subject Professor Terroine has endeavoured to follow the tradition of Claude Bernard—that it is the primary task of the physiologist to observe, describe, and analyse the phenomena that actually occur in living animals. He is a well-known authority on metabolism, and this volume gives a clear and well-balanced account of a very important aspect of nutrition.

Preparations and Appliances

MODIFIED CLIFTON'S PROCTOSCOPE

MR A. LAWRENCE ABEL, FRCS, writes

This proctoscope is a modification of the already popular Clifton's proctoscope. It has been in use for two or three years and has proved very satisfactory. The chief points about it are:

It is long enough to allow a complete inspection of the anal canal in the fattest patient.

The fenestrum occupies about one third of the circumference of the distal third of the instrument. This allows the careful inspection of approximately one quarter of the anal canal and at the same time keeps the remainder of the passage away from the part under examination.

Its passage is completely guarded and rendered quite smooth by a well-fitting obturator.

Its proximal end is wide enough to allow clear vision and the easy insertion of instruments, needles, etc.

Its handle carries a light which shines into the lumen of the proctoscope and does not confuse the eye of the examiner.

Its interior is dulled, giving no reflection from the walls but an excellent view of the pile-bearing area.

The whole is easily cleaned. It is fitted up and taken to bits in a second and has proved a most useful instrument. It is strongly and lightly made with a good finish by Messrs Down Bros.

LIVER EXTRACT FOR PARENTERAL USE

'Examen' (Glaxo Laboratories Ltd.) is a concentrated liver extract for parenteral use. The makers claim that it is the purest liver extract hitherto prepared on a manufacturing scale. The preparation only contains between 5 and 7 mg solids per cubic centimetre, yet 2 c.c.m. contain the haemopoietic factor extracted from 100 grammes of liver. Clinical tests have shown that 2 c.c.m. doses at fortnightly intervals suffice for maintenance in pernicious anaemia. A special advantage of the preparation is that it is painless on injection and does not provoke allergic reactions. It can if necessary be administered intravenously.

THE PAGET TRADITION

PROFESSOR GREY TURNER'S ADDRESS

The eleventh Stephen Paget Memorial Lecture under the auspices of the Research Defence Society was delivered at the annual general meeting of that body on June 15 by Professor G. GREY TURNER. The Hon. Sir ARTHUR STANLEY was in the chair, and LORD LAMINGTON the president of the society, who had left the nursing home that day following upon an operation, put in a brief appearance.

Professor GREY TURNER took as his subject What Research Owes to the Paget Tradition. Stephen Paget, he said, was a professional man nurtured in an academic society who knew and highly respected those whose lives were devoted to the search after truth by experiment. His father, Sir James Paget, had also been interested in the development of surgery by the experimental method, and as long ago as 1881 contributed a thoughtful paper on the subject to the *Nineteenth Century* in which he compared the cruelty inflicted on animals in the name of sport and to serve various utilitarian purposes with the occasional cruelty then inflicted on animals in scientific experiment. Sir James Paget in that article summed up the general position in one sentence "Speaking generally it is certain that there are few portions of useful medical knowledge to which experiments on animals have not contributed."

Stephen Paget, the lecturer continued, was one of the kindest and most humane of men, a nature extremely sensitive, with a burning desire to discover truth and so relieve suffering. He recalled how he had lived with his parents in the warden's house of St Bartholomew's where his mother was distressed by the sounds of suffering which occasionally reached her from the operating theatre in pre-anæsthetic days. Paget's zeal for research and its defence led to a meeting being called in 1908 at his house in Harley Street at which the Research Defence Society was formed with Lord Cromer as its first president and Paget as its secretary. Until his death in 1926 Paget devoted a large part of his time to its affairs. To no single person had the society been so much indebted, although no one reading Paget's own history of the society would imagine that he himself had taken any considerable share in its work.

Stephen Paget A Knight of the Pen

Who was this Paget? He was born in 1855 when his distinguished father was struggling for recognition in the surgical world of London and he was the only one of four sons to follow his father's profession. From 1896 he was surgeon to the Ear, Nose and Throat Department of the Middlesex Hospital, but in 1910 largely for health reasons he resigned his hospital appointments and for the most part gave up private practice. In the early part of the war, when some misguided people were endeavouring to dissuade soldiers from inoculation, Paget threw himself into a counter-campaign, delivered innumerable lectures in many parts of the country, and used his pen also to good effect. He was a first rate organizer, a good speaker, but a little too impetuous to be a real orator above all else he was a writer. He always wanted to get at the real facts of the case and put them clearly before those whom he addressed. He had something of the driving force of a Savonarola.

As an operating surgeon he was not specially gifted and was far too sensitive and of too delicate a constitution for the stern wear and tear of a surgeon's life. But he was a pioneer in surgery and his book on *Surgery of the Chest* published in 1896 was one of the earliest to deal with that subject alone. It was no secret that he disliked operative work and he was temperamentally unsuited for the sudden emergencies with which a surgeon was called upon to deal. In writing he was unexcelled. His *Memoirs and Letters of Sir James Paget* was a truly great book, one that should be on the shelves of every

doctor, a classic of biography, disproving the suggestion that a biography should not be written by a near relative. His *Life of John Hunter* was also a perfect piece of biography, well documented and beautifully written, while his *Confessio Medici* (1908) should rank as one of the most remarkable works ever written by a medical man. Somebody had said that Charles Lamb might well have been glad to have been the author of some of Paget's essays. His *Life of Victor Horsley* was a most successful biography of another great exponent of the importance of research in medicine, and Paget's achievement was the more remarkable because he did not agree with everything in which Horsley believed. Another life which he treated with great success was that of Ambroise Paré. An essay on Paré was also included in *Confessio Medici* which the lecturer said should be read and re-read time and again.

Sir James Paget

In everything that Stephen Paget did some influence of the family tradition was to be found. He was immensely influenced by the example of his parents. To get an idea of what that tradition meant to Stephen something must be learned about the life of his father, one of the best-known London surgeons of the Victorian era and one of the most beloved of all time. Professor Grey Turner sketched briefly the career of James Paget, how he overcame the difficulties and handicaps of an impecunious youth, how he had an intuition for research what glory he brought to St Bartholomew's. He recalled an address which he gave to the Abernethian Society when he was eighty years of age. It contained the following "It is often said or implied that a man in our profession cannot be both practical and scientific. Science and practice seem to some people to be incompatible. The like of this has long been said, and it is utter nonsense."

James Paget was a man of many qualities. He was punctilious, averse from quarrels and yet, in defence of a righteous cause adamant, he was also a man of great family affection, insisting on having his children around him even when most closely engaged. He was the last great medical orator of his generation. His Hunterian Lecture delivered sixty years ago was still looked upon as a masterpiece in that respect. Gladstone, himself the greatest orator in the political field, said that mankind might be divided into two classes—those who had heard Paget and those who had not. It was easy to see what an example he must have been to his children.

"In reviewing the long history of scientific research" said Professor Grey Turner in conclusion "one sees how often it has sadly lacked protectors for its workers, for they themselves have been always so intent on their tasks that very few have bestirred themselves in their own defence. But it is a fine thing when someone not actively engaged in research puts on the armour and acts as champion for his maligned fellows. Such was Stephen Paget. James Paget during his lifetime did much for the promotion of research but nothing more valuable than the stimulus he gave to his son for his example fired the young man with his own indomitable ardour from which this society has so greatly profited."

Professor A. V. HILL and Professor C. LOVATT EVANS briefly spoke to a vote of thanks and a presentation was made by the chairman to Miss Burgess Brown, who has been secretary of the society since 1911. In the annual report which was adopted at the meeting attention was drawn to the fact that the opponents of orthodox medicine are making increasing use of the machinery for propaganda which the anti-vivisection societies have been able to organize. A campaign against accepted measures for preventing disease particularly diphtheria, had been brought to the notice of the society during the year. In certain areas the work of public health officers had been rendered more difficult and more costly to the community by these attacks. They had been met by a leaflet written by Sir Leonard Rogers 10,000 copies of which had been sent to medical officers of health in various parts of the country.

BRITISH MEDICAL JOURNAL

LONDON

SATURDAY JUNE 26 1937

NUTRITION IN AUSTRALIA AND
IN INDIA

The third report of the Advisory Council on Nutrition of the Commonwealth of Australia (over which Dr J H L Cumpston, Director General of Health, presides) is an interesting document,¹ revealing an admirable comprehensiveness of research activities on a subject of the first importance. It recounts the progress that is being made in the collection, compilation, and analysis of family budgets in the various States of the Commonwealth—an enterprise that can scarcely fail to yield valuable results. It deals with investigations made and to be made, into the prevalence of malnutrition in school children with a proposed investigation into the mineral contents of foodstuffs, of water supplies, and of special diets in common use and with popular education and propaganda. In regard to the last the Council recommends that a competition be held with a substantial prize for posters illustrating certain phases of nutrition—an idea that might well be followed in other countries.

An interesting report on a nutritional survey of school children in South Australia, by Dr F W Clements, is reproduced in full. It will repay study by those called upon to make such surveys. He found that among the 925 children examined nutrition was unsatisfactory in 135 or 14 per cent. Rickets was detected in 61 children representing 6 per cent of the total population examined. Dr Clements states that 'rickets was undoubtedly responsible for the unsatisfactory nutrition of a number of children. But is it not that the unsatisfactory nutrition was responsible for the rickets?' The numbers of children having carious, stopped or missing teeth varied within relatively wide limits in different parts of South Australia.

In those schools situated on the calcareous belt the incidence of affected mouths was 37 per cent against 65 per cent and 55 per cent in the schools in the shale belts. Dr Clements refrains from drawing conclusions in regard to the significant difference, contenting himself with assuming that some external factor or factors have been responsible for these differences.

In another appendix to the Council's report Professor Harvey Sutton has much of interest to say both in regard to the definition of the term "malnutrition" and to the estimation of malnutrition in populations. A complete review of the tests for malnutrition is he affirms, long overdue. Speaking of the numerical methods of estimation of malnutrition he makes the pertinent remark that "although many such numerical methods have been attempted, all have succeeded in part, failed in part, and it is likely that any future attempts will also fail if it is thought that the complex known as malnutrition can be expressed within a single formula, and that every individual who is imperfectly nourished can be automatically defined by a single qualitative test." He outlines a method of investigation of malnutrition in school children which the Council, while recognizing the difficulties associated with such an inquiry, agreed to adopt. Two resolutions were passed—the first dealing with the provision of a daily supply of milk for school children and the second with the desirability of formulating standards for bread. The Council was of opinion that the provision of milk for school children "would be a measure of great public health value. Its ultimate effect in reducing the amount of hospitalism would probably be very great." Because of its format the report is awkward to handle and difficult to read especially when it has been through the post.

Within recent years the Government of India has issued short official statements dealing with public health matters. Health Bulletin No 23 on the nutritive value of Indian foods and the planning of satisfactory diets² is the latest addition to the series. It has been prepared by the director and staff of the Nutrition Research Laboratories Coonoor, who are to be congratulated both on its matter and on the manner of presentation. Its purpose is to summarize the available knowledge about the nutritive value of Indian foodstuffs for the benefit of public health workers, medical practitioners, superintendents of residential institutions and others interested in practical dietetics. This purpose it admirably fulfils. Analyses including the calcium, phosphorus, iron and vitamin contents of over 200 foodstuffs are given with the aid of which it is possible to work out 'balanced diets' for individuals or groups. The meaning of the term 'balanced diets' is made clear and a brief statement outlining modern dietetic principles is given. An example shows how the average ill-balanced Indian diet may be made satisfactory at relatively little extra cost. This is effected by substituting whole or lightly milled cereals for part of the

highly milled rice in common use, and by adding milk, green leaf vegetables, and fruit to it. When available funds do not admit the addition of even half a pint of whole milk to the diets of necessitous children, butter-milk or skimmed milk reconstructed from skimmed milk powder, which is considerably cheaper, may be supplied. Careful experiments have shown that the giving of 8 ounces of skimmed milk daily to children fed on an average ill balanced Indian diet "results in a great acceleration of growth and a great improvement in health and well being." Emphasis is laid on the great value of fresh green vegetable foods—the fresher and greener the better, the cheaper varieties—amaranth leaves, coriander leaves, drumstick leaves—being as nutritious as the more expensive ones, such as lettuce. In this connexion we are reminded of such valuable vegetable foodstuffs to be found in country districts of Great Britain, as turnip tops, dandelion leaves, nettle tops, and nasturtium leaves. The nutritive value of pulses and of undermilled cereals is insisted upon, while an intake of animal protein well below that usually recommended is regarded as sufficient.

There are many things in this Bulletin that have an interest for public health workers, medical practitioners, and others in this country as well as for their brethren in India. Its chief lesson is that it is possible to ensure good nutrition, health, and well being on diets composed of whole cereal grains, milk and its products, green leaf vegetables, pulses and fruits without, or with but little, consumption of meat. The Bulletin is certainly worth the two annas or threepence it costs, and the Government of India has performed a notable public service in making it available at so trifling an outlay.

THE GENERAL REGISTER OFFICE

On March 20, 1837, the British Medical Association met in Southwark under the chairmanship of Mr George Webster of Dulwich who reported, among other things that he had had an interview with Mr Chadwick the secretary to the Poor Law Commissioners, on the medical aspects of the Poor Laws and that a petition was to be presented to Parliament relative to an amendment of the General Registration Act "in which, although there was a column for the registration of deaths, yet there was no provision made for ascertaining accurately, the cause of death of which it was very desirable to have exact returns". Whether the proposal emanated from Edwin Chadwick as has been claimed, or was suggested to him by the British Medical Association does not

appear, but it is interesting to recall that the Association which honoured William Farr on retirement nearly fifty years later took an active part in procuring the amendment which made his life work possible.

Perhaps there is no Government Department the growth of which has been so universally approved and in which the medical profession can legitimately take so much pride as the General Register Office. It is natural that in the publicity attending the present celebration more prominence should be given to such general topics as the romance of marriage registers than to more statistics. But the medical reader's point of view will be different. The harmonious co-operation of the staff of the General Register Office and the practitioners of the country was the foundation of medical statistical knowledge. The great man—whose name will be so rarely mentioned in the newspapers this week—who created medical statistics had himself been a general practitioner. Intellectually bold, almost to temerity, he was patient and sympathetic. He refused to irritate those who were to provide him with information by officially prescribing what might seem a logical system of nosology. Indeed he even annoyed some professional authorities of a century ago by expressing a preference for vernacular over "scientific" descriptions on death certificates. Chadwick tried to bully the public, and sometimes the profession, into the paths of sanitary virtue. Farr could be fierce enough about the high death rates of urban areas, he could indict water companies, but he did not try to drag on certifiers. No doubt he sometimes regretted the uninformative character of many death certificates, but he never sneered at general practitioners, and the changes he made in classification he introduced very gradually. Fifty seven years have passed since the Gold Medal of the British Medical Association was awarded to William Farr in recognition of "his long, unwearied, and successful labours in behalf of statistical and sanitary science." The annual reports of the Registrar-General have grown so much in bulk that the personal and individual note of the once famous "letters" has inevitably been lost. But the spirit of co-operation lives on. In Farr's official successors were found men who believed with him that, although practitioners made mistakes like other human beings no man, or committee by the adoption of ingenious rules of attribution could improve upon the simple plan of giving statistical effect to what the certifier said. When a successor of Farr's said that it was not the business of the General Register Office to tabulate causes of death but to tabulate what practitioners stated to be causes of death, he was not being cynical or humorous. He was

laying down a golden rule—a rule not universally followed by official statisticians

The century now ended has witnessed great progress, the century beginning will see greater progress, because there is still sympathy between certifying practitioners and official medical statisticians and the level of professional knowledge has risen. The whole profession will rejoice with Sir Sylvanus Vivian and his colleagues on the success of their festival and wish them heartily well in their future labours

THE NUTRITIVE VALUE OF RAW AND PASTEURIZED MILK

The value of pasteurization in destroying pathogenic bacteria in milk is beyond question. There is indeed a growing consensus of opinion among bacteriologists and medical officers of health that compulsory pasteurization offers the only adequate safeguard against the many infections that may be conveyed to man by this means—some of them arising in the cow itself, others conveyed to the milk by human carriers during handling and distribution. It is clear, however, that the prevention of infection is only one part of the problem to be solved. The milk in addition to being bacteriologically safe must retain its nutritive value. A number of papers have been published dealing with this point and it is fair to say that no decisive evidence has been obtained that pasteurization has any significant effect on the nutritive value of milk, but further and more precise experimental data are required before the problematic risks of this procedure can be accurately balanced against its undoubted advantages. A paper by Wilson Minett and Carling¹ in the current number of the *Journal of Hygiene* records an experiment that has yielded striking and unequivocal results. It was carried out on a herd of cows at the Berks and Bucks Joint Sanatorium. From July 1934 to September 1936 the calves born in this herd were hand fed for the first eight weeks of life after receiving the mother's colostrum for the first 31 days. They were fed on the mixed milk of the herd, but to one group of twenty-five calves this milk was given raw, while to another group of twenty-three calves it was given after pasteurization at 145° F. (62.8° C.) for 70 minutes followed by rapid cooling. Both groups were in addition given an unlimited ration of hay. In order to avoid any possible selection, alternate calves in order of birth were allotted to the raw and pasteurized groups. This resulted in two calves that were obviously sick at birth being allotted to the pasteurized group. Both died

the eight-weeks period was 53.72 lb in the group fed on raw milk and 53.86 lb in the group fed on pasteurized milk corresponding to a percentage increase in weight of 61.18 per cent. in the former group and of 62.94 per cent. in the latter. The greatest individual gain in weight among the bull calves (80 lb) and among the heifer calves (63 lb) occurred in animals fed on pasteurized milk. At no time during the experiment was any observer able to distinguish between the animals belonging to the two groups. Thus in two groups of animals reared on the same mixed milk derived from females of their own species and differing only in the fact that in one group the milk had been submitted to pasteurization there was no evidence that this procedure in any way affected the nutritive value of the milk.

INTESTINAL FLORA OF CHILDREN

The bacteriology of gastro-enteritis in children is a complicated subject. Widely different organisms have been incriminated for various small epidemics of an apparently infective origin occurring in children's institutions in which the milk supply is clean. It has been suggested that the infective agent in these cases may be an ordinary coliform bacillus, the virulence of which has become exalted by growth in an unusual situation—for example the small bowel. Recently A. W. S. Blacklock, K. J. Guthrie and I. Macpherson, working in the pathological department of the University and Royal Hospital for Sick Children, Glasgow, have carried out an investigation¹ on the organisms present at different levels of the gastro-intestinal tract in infants and young children. Four groups were studied. In one of these—fifty cases of acute, subacute or recurrent appendicitis which came to operation—the intestinal flora was investigated with the aid of a needle inserted obliquely through the bowel wall during operation. The findings were recorded as approximately normal and formed a basis for comparison with those obtained post mortem in three groups of patients. One consisted of thirty-six subjects whose death was not due to infection; a second of forty-two children dying of some diffuse paraneural infection; and the third of forty-six cases of primary acute non-specific gastro-enteritis. The first of these three groups served as a control for the other two. It is not possible here to give full details of the bacteriological findings. It is clear that in children with a normal gastro-intestinal tract there is an almost entire freedom from organisms, particularly coliform, in the upper coils of the small bowel. Similar results were obtained both from the patients operated on for simple appendicitis and also from the post mortem examination of those who died as a result of accident to the group during operation of paraneural infection coliform

down in the normal physiological functions, including the level of gastric acidity, which maintain a relative sterility in the upper part of the highly absorptive small bowel. In over 90 per cent. of the cases of gastro-enteritis purulent exudate was found in the middle ear but the authors believe that infection of this cavity was generally due to direct spread of organisms from infected material in the nasopharynx. It is evident from conflicting views in the literature that it is often difficult to decide whether otitis is secondary to gastro-enteritis or vice versa but the presence of coliform bacillus in cultures from the middle ear in a number of the cases investigated at Glasgow suggests that the primary lesion is generally intestinal. Apart from the question of the source of infection in primary gastro-enteritis it seems clear that imperfectly digested food in the small bowel is a rich nutrient medium for coliform bacilli and that ascent of such organisms is probably secondary to a disordered state of the stomach and of the upper part of the small bowel. It is interesting that even in dysenteric ileo colitis coliform bacilli were not abundant here. An attempt was made to determine the effect of pyrexia on the normal intestinal flora but the findings showed much discrepancy. Some authorities have noted that elevation of temperature causes a rich bacteriological flora to appear in the duodenum and in the Glasgow series this was to some extent confirmed for both the non septic group and the gastro-enteritis group. On the other hand in infants with parenteral infection there was a lower incidence of coliform bacilli at all bowel levels in those with marked fever as compared with those who were relatively apyrexial.

INTELLIGENCE OF A RURAL POPULATION

Investigations of the standard of general intelligence in various communities are of great value in sociological genetic and other research. Mr M V Matthews, Mr D A Newlin and Dr L S Penrose of the Research Department of the Royal Eastern Counties Institution have recently published¹ a survey of the intelligence of the 1,500 inhabitants of a rural district of about 7,000 acres. The number of children tested was 187 only a few being missed. About two thirds of them belonged to one clan in which all persons were related by consanguinity marriage or both. Every child of school age was tested with the Otis primary or advanced test, and every child in the age group 8-10 was tested with the Stanford Binet test. After correction for age the Otis scores were expressed in terms of the standard deviation from the mean and the distribution was found to approximate to a normal curve of error. The inter-related group had neither a higher nor a lower mean intelligence than the remaining unrelated group but was a little more compact. The children were divided up into pairs according to whether they were related, connected or unrelated and the degree of likeness of scores between any two related children was compared with the degree between any two unrelated children. The brothers and sisters, and even pairs of children related

in lesser degree, seemed more alike than any pair of children taken at random. There was however no noticeable degree of likeness between children related to one another by marriage and not by blood. Children were also classified in four groups according to whether their fathers were professional men, traders, artisans or labourers. There was a steady gradation down the groups and the children of unskilled labourers had a mean intelligence nearly a third of the standard deviation lower than the general level. The mean intelligence quotient of the Binet-tested group was between 95 and 96 and therefore below that usually found in urban populations. There was no evidence that people who intermarried were less intelligent than the remainder. A survey of mental defect included persons of all ages. Twenty-four cases were ascertained and the total incidence was high 1.6 per cent of the population. The chief anomaly was the large number of feeble-minded females between 20 and 40. This finding suggests according to the authors that a larger proportion of individuals in rural communities must be counted as defective than is officially recognized. There was rather more interconnexion among the defectives than among the general community. The seven cases of insanity were all in the interrelated group.

MALARIA IN EGYPT

Egypt, compared with many tropical and subtropical countries is not seriously affected by malaria. Nevertheless even a small incidence has importance and the extent to which malaria prevails the conditions responsible, and the control measures it is desirable to take against it have for some time engaged the attention of the health authorities. In the eleventh annual report¹ on the anti malaria campaign in Egypt, 1934 an account is given of the composition of the Anti-Malaria Commission, the expenditure sanctioned for anti-malarial work and the work carried out. Altogether in the financial year a sum of £E 20,000 (slightly over an equivalent sum in pounds sterling) was sanctioned for anti-malarial work, the actual expenditure which was a little short of this including £E 6,330 for various anti-malarial works in Cairo about £E 2,000 for certain drainage operations in the canal zone and various amounts for protective works in the provincial towns, rural areas and oases. The work has consisted chiefly in filling burkas (borrowpits and excavations) and constructing and improving drains and irrigation channels. Swamps have been stocked annually with fish "bolit" being used if these swamps are fresh and *Cyprinodon* if salt, the latter being brought from Lake Menzala and habituated to salty water in special breeding places. Over 3,000 cases of malaria were recorded in the year, chiefly between June and December the seasonal incidence being related to the flooding of the Nile. The largest number of cases was recorded from the Kalubia Province (head of the Delta) where the Khanka Malaria Research Station has been established. This station deals with an area of 45,000 feddans (about 100 square miles lying to the north east of Cairo along the region of the Ismailia Canal) and a population of 70,000. Out

of 8,670 examinations made for malaria parasites 736 or 8.4 per cent were positive only 0.5 per cent being malignant tertian. The anophelines found were *A. pharoensis*, *A. multicolor* and *A. nautanensis*. *A. sergenti* also occurs in Egypt, the species in general being in the order mentioned as regards prevalence. (For a very complete account of the anophelines of Egypt see Kirkpatrick *The Mosquitoes of Egypt* Government Press Cairo 1925.) Oocysts were found in 1 out of 35 *A. pharoensis* sent from Edku (an endemic area). Though apparently one of the more severely affected areas the spleen rate at Edku was only 5.18 per cent. The previous annual report (for 1933) gave an account of the origin of the Anti Malaria Commission and the circumstances leading up to its formation. One of the features of its activities has been legislation empowering the competent authorities to inspect premises and compel proprietors to carry out work against breeding of mosquitoes or to perform such work themselves at the owners' expense. A Ministerial Arrêté dated April 24 1930 also added malaria to the list of notifiable infectious diseases.

EUTHANASIA FOR CATS AND DOGS

The National Veterinary Medical Association has issued the report of its committee which was appointed in 1933 to study "the most efficacious method of humanely destroying" cats and dogs.¹ With Major G. W. Dunkin of the National Institute of Medical Research laboratories, as chairman, the committee comprised two senior clinicians from each of the five veterinary colleges (London Edinburgh Dublin Glasgow and Liverpool). All are experienced investigators who have set forth their scientific observations with commendable brevity and clarity. The intravenous inoculation of magnesium sulphate is a satisfactory lethal agent but the introduction of chloroform hydrocyanic acid or strychnine without previous narcotization of the animal is condemned. Nembutal evipan sodium, and avertin (though not for cats) are satisfactory for inducing anaesthesia prior to the introduction of some lethal agent. The committee does not recommend euthanasia by various gases within "lethal chambers" such as chloroform combined with carbon dioxide motor car exhaust fumes or coal gas. Owing to its dangers to attendants shooting by the discharge of free bullets is unsatisfactory, but shooting with the captive bolt pistol is strongly recommended. Through the ingenuity of Mr. C. R. Gollidge M.R.C.V.S., various electrical devices under the names of electrolethal and euthanator are becoming more widely used by veterinary practitioners; the committee finds them satisfactory and indicates a few minor improvements for the protection of the operator. The electrical lethal cabinet is also recommended though several improvements in its design should be made. The committee clearly defines its conclusions on the efficiency of each lethal method, but on the moral or humanitarian aspect of the problem its directions are muddled. Surely the committee could have answered on each method the simple question

Is it reasonable to assume that the animal has any sense of impending unpleasantness when subjected to the particular method? If the answer was in the affirmative the committee should have unhesitatingly condemned the method however efficient cheap or easy it might be. Had this criterion been applied the committee might have found that either the captive bolt pistol or the electrical killer was "the most efficacious method of humanely destroying" cats and dogs.

HEALTH EDUCATION

If the British public are not health conscious it is not for lack of organization or material. The *Health Education Year Book*¹ reveals a great profusion of societies energetically distributing posters and pamphlets and arranging lectures exhibitions and the projection of films and lantern slides. One might fear that the multitude of counsellors would confuse understanding but there is a certain amount of specialism among these bodies—some concentrate on care of the teeth some on care of the eyes some on diet some on social hygiene and so forth—and there seems to be very little overlapping. We count seventy-seven organizations which are wholly or partly concerned with health education. Their publications range from leaflets to textbooks. An extraordinary amount of art has been expended on poster propaganda and many of the posters in arresting colours have the true admonitory touch. Thus the Eugenics Society bids one to "Live love and marry wisely" the Association of Maternity and Child Welfare Centres asks "Why is your child naughty?" and the National Ophthalmic Treatment Board "Do you find it easy to thread a needle?" The Dental Board for a statutory body strikes an almost frolic note both in its posters and in its films with such titles as "Smile if you dare" and "A brush with the enemy." The film as a means of appeal and instruction has been eagerly seized upon by these bodies and a surprising number of films on health subjects sound and silent and of both the 16 and the 35 mm size are available. The list given runs to a couple of hundred reels some of them ambitious productions indeed one issued by the British Social Hygiene Council, and illustrating the manifestations diagnosis and treatment of syphilis is over 10,000 feet in length and takes two and a half hours to show. Some of the titles of the films are alluring. "Castles in Chalk Farm" is presented by the St. Pancras House Improvement Society, "Managing Molly" comes from the National Baby Week Council and "The eyes have it" is a happily entitled film from the National Ophthalmic Treatment Board. There are also films designed not so much to strike the eye as to instruct in a routine. One of these is issued by the public health department of Hounslow and shows the running of a diphtheria immunization clinic "without tears" as its producer says it includes "shots" of the children's faces while immunization is taking place. Another series of films issued by the National Council for Maternity and Child Welfare illustrates various phases of infant management and Kodak Ltd. have

three films illustrating procedures in home nursing. Many of the societies arrange exhibitions with models and charts. Some of them stage plays—"Beauty's Bloom" by the British Red Cross Society, and "The Terrible Twins" by the Health and Cleanliness Council, for example. Panels of lecturers competent to deal with every side of health on which the public can usefully be instructed are available, most of them medical men and women at very modest fees. This *Year Book* will prove a very useful compilation for medical officers of health, directors of education, secretaries of health associations and friendly societies and any who have to do with health education work. The difficulty we should say is not in the availability of material for instruction in personal and civic hygiene but in bringing it before public audiences or rather in securing public audiences of the type who need such instruction. The Central Council for Health Education which publishes the *Year Book* has at the invitation of the Minister of Health and the President of the Board of Education agreed to co-operate in conducting a national health campaign in the autumn of this year. The campaign is to extend over a period of six months and special emphasis will be laid on such matters as maternity and child welfare services, school health services (including the milk in-schools scheme), social hygiene and tuberculosis. This is an important move in the application of preventive medicine and we wish it all success.

TERRITORIAL ARMY GENERAL HOSPITALS

The War Office has decided to organize twenty-nine Territorial Army General Hospitals for duty in this country in time of war and a statement showing the peace and war establishments of officers which have been approved for each unit is published in our *Supplement* this week (p. 414). It is intended that each hospital should be able to accommodate 600 patients in the first instance and be capable of extension up to 2,000 beds should necessity arise. It will be observed that the part-time visiting staff are to be civilians who will be appointed in peace time. The other civilian appointments also part-time will be of medical practitioners for general duties and will be made after embodiment. Part-time officers will be not less than 50 years of age. The establishments have been drawn up with a view to providing an adequate staff while interfering as little as possible with the medical care of the civilian community.

AMBULANCE UNITS IN ETHIOPIA

The report of the British Ambulance Service in Ethiopia Committee is published by the British Red Cross Society. This is a most unusual report and consists of a vivid straightforward narrative of the formation of the service—despite almost insuperable difficulties of finance and the trials of red tape—and the movements and work of the two units in Abyssinia. The greater part of the report is devoted to the first unit which originally intended for the Southern front travelled from Berbera to Addis Ababa whence it followed the

Northern armies to the Ashangi Plain. Crippled by an aerial bombardment, the unit continued its work in a mountain cave until obliged to return to the capital for reorganization. There despite the untimely death of its devoted leader, Dr. Melly, it performed further valuable services during the three days' anarchy which preceded the arrival of the Italians. The second unit entering Abyssinia from the Sudan at a later date only reached Gondar a few days before the Italian troops and its work came to an end almost before it had been begun. This report, which includes an excellent map and is illustrated by numerous photographs, is well worth reading. Copies may be obtained from the Secretary, British Red Cross Society, 14 Grosvenor Crescent, London S.W.1.

EPSOM COLLEGE

The eighty-fourth annual general meeting of the Governors of Epsom College was held at the office, 49, Bedford Square, W.C.1, on June 18, with Lord LEVERHULME the president, in the chair.

The results of the last election of pensioners, foundation scholars, and annuitants were announced by the chairman, as follows:

Foundation Scholarships

Adie William A. C.	Bridger Peter J. D.
Berry Oswald	Milne, Dennis G.
Robinson Neville A.	

For a Pensionership (£40 p.a.)

Hutton, Mrs. Bertha L.

For an Annuity (£34 p.a.)

Hitchins Miss Fanny V.

(In addition grants were made to various unsuccessful candidates.)

Lord Leverhulme referred to the continued increase in the number of boys, and said that in 1936 the average was 446, of whom ninety-three were day boys. He also referred to the Royal Patronage which King George VI had graciously consented to extend to the school to the fine record in scholarship work that the school had attained, no fewer than five open scholarships having been secured. One of the boys had won the public school quarter mile at the White City, and one master had gained his rugby cap for England. The president drew special attention to the paragraphs in the annual report dealing with tax-free subscriptions to charities. He pointed out that if all the Governors would sign the deed of agreement (which could be obtained from the office) it would mean an increase of from £1,500 to £2,000 a year for the funds of the Royal Medical Foundation at no cost whatever to the subscriber.

The following ten members of the Council were re-elected for a further period of three years: Dr. J. W. Carr, Dr. Ronald Cove-Smith, Mr. F. S. Fleuret LL.B., Sir William Hale White M.D., Mrs. Robert Hutchison, M.B., Dr. Reginald L. Langdon Down, Dr. Arnold Lyndon, Dr. Philip H. Manson Bahr, Mr. Arthur W. Ormond, F.R.C.S., and Mr. Julian Taylor, F.R.C.S. Professor John A. Nixon M.D., and Dr. Henry Robinson were elected vice-presidents of the College. Colonel Norman C. King, Mr. H. H. Rew, and Mr. H. A. Decker A.C.A., were appointed auditors for the ensuing year and the chairman of the College proposed a hearty vote of thanks to all honorary local secretaries, the British Medical Association, the Medical Insurance Agency, the Charities Committee of the British Medical Association, numerous Panel Committees, and the Editors of the *British Medical Journal* and the *Lancet* for all the work that they had done on behalf of the Foundation.

THE NEURO-PSYCHOLOGICAL BASIS OF CONDUCT DISORDER

MORISON LECTURES BY DR R G GORDON

The Morison Lectures, under the auspices of the Royal College of Physicians of Edinburgh were delivered by Dr R G GORDON of Bath a Fellow of the College on June 17 and 18. Dr Gordon took as his subject 'The Neuro-psychological Basis of Conduct Disorder'.

In his first lecture he premised that conduct disorder would depend upon one or more of three principal factors: (1) an interference with the functional integrity of the body; (2) a similar interference with that of the mind; (3) an environment pressing too hardly upon the individual or demanding too much of his unaided effort. The angle from which he proposed to discuss the subject was one not usually taken in current polemics—namely the abnormal event which was taking place in the nervous system of an individual when performing an unusual or asocial act.

Modern psychology held that the dynamic basis of behaviour was emotional and that when behaviour was erratic or ill adapted it was because there was an incoherence in the emotional reactions. It was necessary to understand the neurological basis of emotional life and those functions of the brain which subserved affective experiences. The knowledge of the working of the brain was increasing rapidly: old conceptions of localization were being revised and corrected almost every day. It was beginning to be realized that in many respects the brain worked as a whole, but that certain areas possessing cyto-architectural structure and arrangement had the duty of organizing and controlling special functions. 'However much we study the brain as a whole we must not forget the function of its parts, and however much we study the parts we must not forget the function of the whole.'

It was not only in the cortex that new knowledge of functional localization was being obtained. The centres in the diencephalon and mesencephalon, which concerned in the one case the various autonomic activities and in the other the tonic variations in skeletal musculature, were known, and in the thalamic area there were known to be centres which played an important part in the affective life of the organism.

Disturbance of Control

In the realm of abnormal behaviour, according to modern psychiatry it was distorted and confused affective impulses and reactions that were primarily concerned, and distorted ideas and conduct were secondary to these; therefore it was clear that disturbances of diencephalic and mesencephalic function or control must be explored if these conditions were to be interpreted on a neurological basis. The lecturer was careful to point out, however, that the majority of examples of conduct disorder were reversible—that is to say, they did not represent permanent changes in character. It was an alteration of function, not of structure, that had taken place, and therefore the clue was likely to be found not in the diencephalic centres themselves, but in the inhibitions and releases impinging upon them from above. Moreover, it was behaviour disorders of an essentially cortical nature which were being investigated and consequently it must be determined exactly how cortical influences were conveyed to the diencephalic centres and vice versa. Here was one of the most noticeable gaps in exact neurological knowledge. Very little was known of the anatomy and physiology of cortico-autonomic connexions.

It was convenient in psychological discussion to speak of cognition, affection and conation, and if the brain were thought of as divided laterally by the central sulcus rather than longitudinally, the neurological correlates to

this grouping could be to some extent envisaged. Behind the central sulcus was the receptive area of the brain: the parietal, temporal and occipital lobes subserving not only the areas for the reception of common sensation, but also the areas concerned with the integration of these sensory impressions into images. Here the lecturer briefly discussed the possibility that the hinder part of the brain might be regarded as the correlate of cognitive activity, though any such division was to some extent misleading because at these high levels the brain worked as a whole and in order that the ideas derived from visual or auditory imagery might be expressed the effector frontal or pre-central part of the brain must be brought into play. In front of the central sulcus were areas largely effector in function, and this part therefore might be correlated with conation. It was difficult to demarcate affective and conative behaviour from one another, so that if a central area of brain comprising the thalamus, hypothalamus, and their cortical connexions was regarded as essentially subserving affection it must also be thought of specially in relation to the prefrontal area which as Kuntz said 'plays an important role in the emotional drive which is a major factor in much intentionally directed effort'.

Excitation and Inhibition

Dr Gordon went on to point out the importance of realizing that two functions were to be observed when stimuli reached the cortex—namely excitation and inhibition. Pavlov in his studies on conditioned reflexes had pointed out that when a stimulus reached a certain point in the cortex a widespread radiation of excitation might ensue followed by an antagonistic radiation of inhibition, which would ultimately limit the field of excitation to a strictly defined area. The generalized convulsion illustrated the more or less unlimited radiation of excitation and sleep the more or less unlimited radiation of inhibition.

Some people were less capable of inhibition than others, and it had been suggested that this relative defect was due to faulty control of higher neuronic structures over lower ones. An important factor in determining conduct disorder was a failure of the inhibition and regulation demanded by the social code, and it was possible that when two brothers were brought up in exactly the same domestic environment and under the same code the reason why one of them became a thief and the other did not, given apparently the same set of stimuli was that in respect of a particular pattern the relative irradiation of excitation and inhibition was different. That acquired and inherent emotional attitudes differed in individuals, even in twins was obvious, and therefore it was not surprising that the thalamo-cortical patterns should show wide variation in their susceptibility to excitation and inhibition, and consequently that the choice of one out of a multitude of possible responses to a situation should not always be the same.

Organic Factors

The lecturer expressed his belief that by far the greatest number of cases of conduct disorder in children were due to psychological and environmental causes. In a series of 200 'conduct' cases no organic factor could be discovered in 76 per cent. Even in cases in which there was a prominent organic factor this was by no means the only operating cause. Indeed, it might be said that the organic cause merely loosened the controls or unbarred the gates so that an uncoordinated emotional drive easily carried the individual into abnormal behaviour.

A boy of 8 was brought to him for regular nocturnal enuresis. Clinical examination suggested the presence of a spina bifida occulta: x-rays disclosed an absence of the sacral laminae and it seemed reasonable to assume that the enuresis was due to an early malformation of the regulating sacral centres and that therefore not very much could be done. There were however certain circumstances in the home and a typical attitude of petulant despair on the part of the mother

which made him suspect an emotional factor such as was at work in the vast majority of cases of enuresis. The boy was taken into hospital and improved under treatment. Then the situation was carefully explained to the mother that the boy had less power of control than most children of his age owing to congenital abnormality and that it was of the utmost importance that the home environment and her attitude towards him should be scrupulously correct. She co-operated reasonably well with the result that the bed wetting occurred only now and then and the frequency of these accidents was steadily if slowly diminishing.

In his opinion the same kind of thing happened in most conduct disorders, more than one factor was operative certain influences weakened the control and disturbed the integration, while others fired off the unchecked emotional disturbance which determined the homicide, assault theft or whatever it might be. Were it not for integration and control by higher levels of personality every threat to the person would result in precipitate flight every thwarting of desire in violent assault, and every stimulus to the acquisitive instinct in theft. The problem was not so much why a theft was committed as why it was not prevented, what had interfered with the normal integration of the personality. The answer was in the interference with the proper integrative action between the cortex, both receptor and effector, and the affective mechanisms of the thalamus.

Conduct Disorder Due to Epidemic Encephalitis

Disturbance of the orderly sequence of response was well illustrated in conduct disorder due to epidemic encephalitis. It was probable that in certain sequelae of encephalitis vascular changes occurred which became more or less permanent lesions, interfering with normal cortical control and especially upsetting the physiological relationships between cortex, thalamus, and hypothalamus. Such lesions would readily account for the temper outbursts, the change in affections, and the mischievous behaviour as opposed to normal conduct. In the encephalitis case the passage from stimulus to response was interrupted and confused by the organic lesions, and yet it had been shown that careful training, suitable occupation, and freedom from conflicting and inappropriate stimuli would do good even in these cases and prevent the worst manifestations of conduct disorder. Where one particular behaviour manifestation was persistent it was worth considering whether in the environment there was an undue weight of stimulus for this instinctive reaction. If outbreaks of temper were the characteristic manifestation it would be well to ensure for the child as non irritating an environment as possible although in many cases this might not make much difference.

Dr Gordon closed his first lecture with some remarks on chorea in which behaviour disorders were by no means uncommon though usually of a minor character. Choreic children were jerky in mind as well as in body. He cited one fatal case which was investigated microscopically. It seemed clear from this case, which was typical of others that while the main incidence of trouble was upon the thalamo striate and midbrain regions the cortex, with the exception of the pyramidal projection system might be considerably and seriously involved. It might be assumed therefore that there was a considerable interference with general cortical control, and especially with the cortico thalamic apparatus and it was not surprising that these children were excitable restless subject to outbursts of temper and crying for the proper sequence of response to stimuli was interrupted and diverted by the lesions which were scattered more or less irregularly through the brain.

The Epileptic Personality

In his second lecture Dr Gordon considered the condition of epilepsy. Epilepsy, he said, was a biological

defect and rendered the individual incapable of adequate social adaptation, so that the adult reactions became necessarily abnormal. The epileptic was solitary, selfish and incapable of the normal affections. He showed egotism morbid sensitiveness, and poverty of ideas. He was often moody, with periods of lethargy, alternating with outbursts of hastiness.

This "personality" might quite frequently be recognized, and was not seldom guilty of conduct disorder or the subject of some form of psychoneurotic reaction. It was a manifestation of a special type and degree of cortical inefficiency. Among the effects of this inefficiency was the occurrence of epileptic convulsions, but these depended also on other factors, and might, and often did arise in the life history of individuals who did not manifest this personality. While it seemed likely that the effector area of the brain was not altogether normal, such a personality might be a highly integrated egocentric individual, with great intellectual capacities, though with a defective power of social adjustment, the extreme example was the epileptic Napoleon. As a rule, however, the epileptic personality manifested, in addition to egocentricity a lack of general control, irascibility temper outbursts, and emotionalism, suggesting a failure of the controlling or inhibiting function which the higher levels of the cortex exerted on lower level activities.

In the symptom of epilepsy, whether fit or its equivalent, the projectile elements involved were in a state of undue sensitivity or irritability, or an undue number of cells were receiving stimuli from the afferent division of the nervous system, or there was an imperfect inhibition or control by higher levels in that system. Probably in most cases all three factors played a part. The first probably depended on biochemical changes involving either cells or synapses. The second might be a factor which was responsible for many forms of psychogenic conduct disorder, and not only psychogenic epilepsy, and the third was of importance in traumatic (Jacksonian) epilepsy, when controlling cells had been destroyed, but might also operate when normal cortical controls were inhibited.

The crime which might be committed in the phase of epileptic automatism was in rather a different category. The process was really the same as that which took place in the somnambulistic dream.

A boy of 18 was a popular and successful member of a public school. He was in his last term and was about to leave to go into a satisfactory job. Without warning or apparent reason he began to create serious disturbances in the dormitory at night. He would begin by talking in a cheerful but bombastic way and presently would get out of bed with the avowed purpose of protecting some small boy. If anyone opposed him he responded with considerable violence with the result that it was necessary to isolate him and have him watched at night by a male nurse. He had no recollection whatever of this behaviour and no clear recollection of dreams. Psychological investigation showed a somewhat deep-seated feeling of insecurity which had no doubt been helpful in pushing him on to the achievement of success in school but was stirred unduly when the change to the uncertainties of a business career was imminent. In waking life, with full cortical function such deep-seated impulses were controlled and repressed but in light sleep when higher cortical patterns were incapable of preventing lower emotionally charged impulses from breaking through these somnambulisms took place. In these the inner conflict was dramatized. He saw himself as the insecure small boy and also as the brave hero striding through all opposition to the protection of that other self.

In this and another case he described he thought there was evidence of the three factors—the lack of proper cortical integration and control the mass discharge of stimuli from the perseverated emotionally charged idea and the spread of excitation and withdrawal of inhibition from certain violent aggressive behaviour patterns.

NOTES OF THE WEEK

Diphtheria Immunization in Manchester

Dr R Veitch Clark, medical officer of health for Manchester, has submitted to the local public health committee a report on the results in the city of the immunization of children against diphtheria. A scheme for the immunization of children of school and pre school age was approved by the city council in June, 1928, and the work is carried out at schools municipal centres and hospitals, and by private practitioners. The medical officer of health says that the average annual incidence of the disease in Manchester during the period 1931-5 was 102 which is a decrease of 14 per cent when compared with the figures for 1923-7. He adds that there is no other known cause for this difference than that of the immunization of the children of the city. Comparative figures of the attack rate per 1,000 show that the average attack rate in children not protected by immunization is fourteen times as great as that in immunized children. The medical officer of health believes that if the immunization scheme could be extended to cover all the child population diphtheria would virtually disappear.

Maternity Service in Inverness-shire

The Public Health Committee for Inverness shire has considered the establishment of a maternity service for the county. The chief medical officer had reported to the Department of Health that apart from a few beds in private and voluntary institutions there was no provision in the county for maternity services and he suggested the establishment of a central institution in Inverness which would be connected with a number of centres in other parts of the county. The Public Health Committee therefore appointed a special committee to confer with representatives of the local authorities in the county and the directors of the Royal Northern Infirmary and to formulate a scheme.

Award to Dr W T F Davies of Natal

The Gold Medal of the Federal Council of the Medical Association of South Africa (British Medical Association) has been awarded to Dr William Thomas Frederick Davies of Natal for meritorious services rendered to the profession. Dr Davies was born in Swansea and is M D of London University. He began practice in Johannesburg in 1890 and soon became one of the leading surgeons in the Transvaal. He has taken a prominent part in medical politics in South Africa and his special object has been the promotion of a high ethical standard in the profession. The vigorous action of Dr Davies was a very important contributory factor in the passing of the Medical, Dental, and Pharmacy Act of 1928.

Dr G W McIntosh has received a presentation from his professional colleagues on the occasion of his retirement from the post of medical officer of health for Kirkcaldy.

Dr James Fenton, medical officer of health for Kensington has been elected president of the Society of Medical Officers of Health for 1937-8.

In consequence of ill health Dr G R Jeffrey has resigned his appointment of medical superintendent of Bootham Park Mental Institution, York which he has held for twenty five years.

The Egyptian Government has appointed Dr A Cecil Alport of St Mary's Hospital Paddington to be professor of clinical medicine and director of the medical unit at the Egyptian University Cairo.

Lord Nuffield who is an Honorary Member of the Association has been awarded the Albert Medal for 1937 by the Council of the Royal Society of Arts for his services to industry, transport, and medical science.

NURSING PROBLEMS

REPORT BY BRITISH MEDICAL ASSOCIATION ON QUESTIONS RAISED BY THE COLLEGE OF NURSING

1 In a communication dated April 28 1936 addressed to the Association the Council of the College of Nursing stated that it had been engaged in considering the following important matters affecting the nursing profession

- Interchangeability of pensions
- The establishment of a domiciliary nursing service.
- The supply of and demand for, the services of the trained nurse by the community
- The care of the chronic infirm
- The problem of the tuberculous nurse.
- The Report of the Joint Council of Midwifery

and that it sought the consideration of the Association to these questions with a view to obtaining, wherever possible its assistance and active support. The College submitted memoranda on each of the above questions

2 The Council has carefully considered the questions raised by the College of Nursing and the Council has had the advantage of conferring with representatives of the College on the subject. The Council of the Association submits the following report

Interchangeability of Pensions

3 The Council of the College has pressed for the principle of interchangeability of pensions since the establishment of the Federated Superannuation Scheme for Nurses and Hospital Officers (Contributory) in 1928. This scheme is one which applies to voluntary hospitals only it is a voluntary arrangement, and it is understood that approximately 75 per cent of voluntary hospitals are co-operating in the scheme. In 1934 a series of conferences between the Council of the College of Nursing and the Ministry of Health were convened and it was hoped that some solution of this problem would result and that the matter might be dealt with by legislation in the near future. All parties represented at the conferences were in agreement upon the principle involved, the only serious difficulty being the means of effecting a practical solution

4 The general outcome of the conferences was that the College arranged a meeting with the officials of the National Association of Local Government Officers, when it was agreed that the National Association of Local Government Officers should consult with the Secretary of the Federated Scheme and prepare, in relation to the Local Government and Other Officers Superannuation Act, 1922, an amended Bill embodying a joint scheme for interchangeability of pensions for nurses serving in and migrating between municipal and voluntary services

5 The Council understands that such a draft Bill is in course of preparation. The object which the College desires to attain is one with which the Association is in full sympathy, as is evidenced by the following resolution of the A.R.M., 1935

It is desirable in order to promote the interchangeability of hospitals staffs (medical nursing, and other) that such staffs should be entitled to carry superannuation rights with them on transferring from the service of a voluntary to a council hospital, or vice versa,"

which has already been pressed upon the Ministry of Health by a deputation. The Council has asked that the Association should be kept informed of developments and has indicated that if the draft Bill is on the lines suggested the Association would be prepared to give it cordial support.

Domiciliary Nursing

6 A Domiciliary Nursing Services Bill (not sponsored by the College of Nursing) was introduced into the House of Commons in June 1934 but after its second reading it met with opposition from the County Councils Association which recommended that such a development should only be inaugurated as the result of Government legislation and after very careful investigation of the administrative financial and medical issues involved. The Bill accordingly lapsed

7 The College of Nursing, recognizing the need for an adequate domiciliary nursing service, interviewed the Minister of Health, and urged that there was need for a domiciliary nursing service that such a service should be effected by Government legislation and should include the following principles

- (i) that the domiciliary nursing service should be available for the whole community
- (ii) that the body providing this service should have the right to recover the cost of the service except in necessitous cases,
- (iii) that all types of disease should be nursed
- (iv) that the authorities to provide, or make provision for this service should be (a) The County Councils, (b) The County Borough Councils and, in the case of London, the Councils of the Metropolitan Boroughs,
- (v) that local authorities should act through a committee to be known as the Domiciliary Nursing Services Committee of which not less than one half should be elected members of the local authority, and the remainder co-opted from organizations having special experience in or engaged in such work
- (vi) that the nursing should be carried out by State registered nurses with district training,
- (vii) that on framing a scheme the local authority should avail itself of the services of existing District Nursing Associations operating in the area of the authority, and should subsidize these associations on a scale to be agreed,
- (viii) that whenever possible the local authority should encourage the formation of new voluntary associations on approved lines,
- (ix) that in any scheme for a domiciliary nursing service provision should be made for safeguarding the interests of nurses engaged in private practice

8 The representatives of the College stated that a survey made by the Queen's Institute of Nurses, with which they were acting in close collaboration, had led both bodies to the conclusion that an adequate trained nursing service did not exist in all parts of the country. They were anxious to evolve a scheme under which the country would be covered by an efficient and adequate nursing service. In their view there was a large volume of sickness much of it of the chronic type, for which no proper nursing facilities existed. In reply to questions raised by the Council representatives of the College agreed that there would be practical difficulties in making provision for the nursing of all types of disease in the manner suggested

9 The representatives of the College also stated that in their view control of any section (or branch) of the profession of nursing should be taken out of the hands of those whose primary interest was commercial. It was stated that many nurses were attached to nursing co-operations and that commonly a high proportion of their fees was paid to these bodies that some of the co-operations employed women who although termed "nurses" were in fact unregistered and not fully trained. This state of affairs was obviously contrary to the public interest. Many co-operations existed primarily for profit, and the provision of efficient nursing services was a secondary consideration. The College hoped to establish a voluntary register of ethical co-operating bodies, but up to the present no attempt had been made to put an end to the exploitation of private nurses

10 While the Council is in agreement with the desire of the College of Nursing that full provision should be made for an adequate nursing service, it considers that the service should, for the present at all events, deal with the type of work being performed by the District Nursing Associations, and should be wherever possible an extension or development of existing District Nursing Associations. Also that it should relate only to domiciliary visiting nursing. It feels that such schemes should preferably be organized and financed on a provident or contributory basis with the addition of voluntary subscriptions where necessary. The local authorities should be urged to make adequate grants and should be represented on the management committee

11 The Council believes that it would be a mistake to couple with such a proposal a suggestion for the control of the nursing co-operations. In the view of the Council these are two distinct problems which should be dealt with separately. The Council suggests therefore that the College of Nursing should in the first place, concentrate upon both the outline and details of a scheme for improving the existing domiciliary visiting nursing

service. The College might also consider schemes for the reform of nursing co-operations. It is suggested that control of those bodies might possibly be achieved by legislation on lines similar to that of the Nursing Homes Registration Act.

Supply of, and Demand for, Services of the Trained Nurse by the Community

12. A conference of representatives of the medical and nursing professions and of the lay public was convened by the College of Nursing on December 8, 1933, to consider the question of the supply of, and demand for, the services of the trained nurse for the sick public. A special committee was appointed to investigate the problem, and this committee came to the conclusion that, while as a result of the economic conditions at that time prevailing there was evidence of some unemployment amongst private nurses, the real cause of the problem lay in the faulty distribution of nurses amongst the civil population.

13. In view of the uncertainty regarding the relationship between the supply of trained nurses and the demand for their services, and of the difficulties encountered in attempting to obtain accurate and comprehensive data regarding the annual output of training schools, and of the actual requirements of the organizations which employed trained nurses, the College of Nursing came to the conclusion that there was a need for inquiry on a much larger scale than could successfully be undertaken by an individual organization. The College presented this view to the Minister of Health, and pointed out that the nursing problem was intimately related to other problems connected with the health services of the community. The Minister was urged to take appropriate action as soon as feasible.

14. The Council understands that at the present time there is relatively little unemployment in the nursing profession. It appreciates the difficulty in obtaining adequate information as to the supply and demand for the services of trained nurses and considers that a comprehensive inquiry conducted by the Ministry of Health might furnish useful information on this subject.

Care of Chronic Infirm and the Essex Scheme

15. The College of Nursing in its memorandum on the above subject stated that it had very fully investigated the problem of providing adequate nursing care for the chronic sick in institutions. This matter had recently been brought into prominence by

(a) the initiation of a scheme by the Essex County Council whereby a particular grade of nurse was to be trained to work under a fully qualified staff, the authorities having found it impossible to procure a sufficiency of suitable nurses for this purpose;

(b) the findings of a Joint Committee composed of representatives of the County Councils Association and the Association of Municipal Corporations, which, in considering the plans of the Essex County Council had recommended that the care of the chronic sick should be recognized as a special service for the improvement of which there should be a special form of training and a diploma, this training to be supervised by, and arranged in conjunction with, the General Nursing Council.

The College of Nursing expressed its opinion that, whilst it was essential that proper nursing should be provided for this particular type of patient, this scheme, if developed throughout the country, might prove a menace to the economic conditions of the nursing profession. The College held the view that it would be impossible for the General Nursing Council to recognize any standard of training lower than the basic standard prescribed for admission to the registers. It suggested that the ideal method of caring for these patients was the employment of non-resident trained nurses under the supervision of trained State registered sisters and the provision of the necessary accommodation in isolated districts. Where this was impracticable and if it was found necessary to employ untrained persons the College proposed

(i) *Title*—That the official title for women taking up this work be 'Attendant on the Chronic Infirm' to be shortened for practical purposes to the word 'Attendant'.

(ii) *Training*—That the local authorities themselves be responsible for such training as is deemed necessary.

(iii) *Testimonials*—That testimonials rather than certificates or diplomas, be granted at the termination of the period of

service, bearing the title 'attendant on the chronic infirm' rather than "nurse".

(iv) *Permanent Posts*—That every effort be made to appoint these workers on termination of their contract to permanent pensionable posts in similar institutions in order to prevent them from undertaking duties for which they are not qualified and also to prevent them from competing with trained nurses working amongst the sick of the community.

16. As a result of a questionnaire the College ascertained that nearly half the institutions concerned had difficulty in procuring trained staff, but that there was comparatively little difficulty in procuring the services of an 'assistant nurse'.

17. It was apparent to the College that in taking up this particular branch of nursing the trained nurse felt that she was losing professional status. It seemed that in most localities efforts were being made to improve the accommodation of the nursing staff and that in most cases practical instruction *only* was given to the assistant nurses or orderlies.

18. The Council of the College called a round table conference consisting of members of the Council of the College, representatives of the Queen's Institute of District Nursing, the Mental Hospital Matrons Association, the County and County Borough Hospital Matrons Association, and the Association of Hospital Matrons, at which the result of the Council's inquiries into this matter was considered. The meeting discussed how best these problems could be solved and it was agreed that it was necessary

(i) to gain the co-operation of the matrons of the county and county borough hospitals, matrons of all recognized public assistance hospitals and the matrons of voluntary hospitals in an endeavour to raise the standard of nursing of the chronic infirm and to urge the importance of this type of work.

(ii) to organize a crusade in the various hospital training schools to endeavour to instil into the staff the need for pioneer work in this branch of the profession.

(iii) to explore the possibility of including in the future some experience in nursing the chronic sick during the period of training laid down by the General Nursing Council.

(iv) to use every influence to improve the economic conditions for nurses working in 'chronic' institutions.

19. Hospital authorities are experiencing great difficulty in obtaining enough trained nurses for the care of the chronic sick. The representatives of the College, while insisting that a second type of 'nurse' is necessary for this work, do not favour the idea that this second type should be included in any State Register of Nurses. She would not be likely to reach the basic standard of general education now demanded for members of the nursing profession and any attempt to include her would tend to lower the standards of the profession.

20. Amongst the suggestions made by the Council of the College of Nursing in its memorandum is one that the local authorities themselves should be responsible for such training as is deemed necessary. Upon this point the Council desires to state its view that the local authorities are entitled to look to the nursing profession itself for a lead as to the kind of training which should be given to the assistant class of nurse.

21. It appears to the Council that the question of differentiation between these two classes of nurse is of the utmost importance and that by making such a differentiation it might be possible to deal *inter alia*, with certain of the undesirable features at present existing in relation to the Nursing Co-operations. The Council believes, moreover, that a solution of the problem is likely to be found only if it is examined from a broader point of view, and it has therefore given careful thought both to the present position and the possible methods of regularizing an admittedly unsatisfactory state of affairs.

22. It will be remembered that the Nurses Registration Act, 1919, established the General Nursing Council for England and Wales. This Council was empowered to lay down the conditions of nursing training to approve the institutions in which such training could be wholly or partly given to examine candidates for entry into the nursing profession to keep the register of nurses and to act as a disciplinary body.

23. The Act was intended to protect the properly qualified nurse from unqualified competitors, and to safeguard the public from exploitation by similar persons. The Council decided that the education of the State registered nurse must reach a high standard

in both theoretical and practical subjects and that if desired specialist experience should be added to the minimum three years training. Recognition was also given to shorter periods of training in special subjects such as the nursing of children and fevers.

24 The result has been a steady output of trained nurses reasonably well equipped. These nurses have found work in hospitals as staff nurses or sisters or have entered private nursing or the public health services. The larger general hospitals have found little difficulty in maintaining an adequate nursing staff, but small hospitals and particularly public assistance or municipal (formerly Poor Law) hospitals where there is a considerable proportion of beds for the chronic sick, have found great difficulty in attracting a well-qualified staff for ordinary nursing duties, partly because of the nature of the nursing itself and partly because of the conditions under which it is carried out. This difficulty has been met (a) by the use of probationers, and (b) by the appointment of assistant nurses. The use of probationers depends on the recognition of the hospital as a training school but even where they are accepted there is still great difficulty in obtaining trained staff nurses.

25 The employment of the assistant nurse is often thoroughly unsatisfactory. Under present conditions she has a well-established position in the public assistance nursing service though the General Nursing Council neither controls nor recognizes her. She may be a probationer who for some reason has not completed her training, or she may start with no training at all. She may be employed as a temporary staff nurse (for responsible work) not infrequently at a higher salary than a full trained staff nurse receives. She is frequently in and out of a post, with no lasting responsibility. She sometimes drifts from the public assistance service into a nurses' co-operative society from which she may be sent out to an ill-informed and unsuspecting public as a trained nurse.

26 On the other hand, it must be remembered that the assistant nurse is often a valued officer in a public assistance institution. Many non training hospitals are regularly nursed by assistants working under trained staff nurses and some of these assistants have been most carefully taught the nursing of senile or chronic patients by the head nurse or sister under whom they work and carry out their duties faithfully and well. It is professionally wasteful to use the highly qualified nurse for this type of work, and there is a clear need for the services of a less-skilled officer in certain institutions.

27 At the same time the nursing of chronic patients is not merely a matter of putting them to bed, feeding them, and keeping them clean and free from bedsores. A patient may easily become prematurely and permanently bedridden, a condition which is often unnecessary and bad for both patients and nurses. The nursing of the chronic sick might well be far more intelligent and curative than it often is, and the bed fast condition resulting from kindly but ill directed care could often be avoided.

28 The establishment and recognition of a second grade or class of nurse is a difficult and controversial subject. It is a proposal which would be likely to meet with keen opposition from a certain section of the nursing profession. Some nurses would probably feel that it had taken many years to win the status and recognition accorded to them by the Nurses Registration Acts. They would resent any step which might appear to lower or to damage in any way the position, prestige or financial outlook of the State registered nurse, and might consider that any formal recognition of a lower grade of nurse would have this effect.

29 On the other hand, many nurses evidently realize that nursing covers an extremely wide field and that the qualities and experience required by the highly educated women who reach the top of the profession are largely different from those needed by nurses who are in charge of chronic sick and infirm patients, and who may seldom see a case of acute illness. They are disposed to think that the time has come to reconsider the whole question of training in the light of experience gained by the General Nursing Council, the transfer of the Poor Law hospital to the local authority and the possibility of an extension of visiting nursing services. The question was mentioned in the report of the *Lancet* Commission on Nursing, and has been discussed from time to time in nursing journals. It has recently come to the front by reason of the action of the Essex County Council in setting up a scheme for a training of their own staff for nursing the chronic sick in the County public assistance hospitals.

30 At least it seems clear that the matter is ripe for discussion. The continued employment of unqualified nurses who are under no general professional supervision or control is undesirable. As there is no likelihood of replacing such persons by a fully trained staff it is highly desirable that their position should be defined and regularized and a clear demarcation made so that the public could readily distinguish between the trained nurse and the unqualified assistant.

31 There are three classes of women who may have duties in regard to the sick: (1) the State registered nurse, (2) the unqualified or assistant nurse, and (3) the wardmaid or attendant. The first two have nursing duties, the third should be concerned only with the environment of the patient, though there is some times a tendency to expand the work into minor nursing.

32 There is often confusion as to the proper sphere of the assistant nurse or whatever name she goes by, and if the duties could be defined and an accepted designation given to her there would be a better chance of a clear distinction being made between the different persons responsible for the welfare of the patient. The nursing profession is naturally unwilling to see the title of 'nurse' bestowed upon anyone who is not a fully trained woman but the title is in such general use, both in nursing and domestic work that in practice it would seem impossible either to limit its use or to protect it (as the term midwife is protected). If suitable terms could be found to define (a) the State registered nurse and (b) the nursing assistant it should be possible to restrict such titles to women with prescribed qualifications and defined duties. We should then have

(1) *The State Registered Nurse*—A well-educated woman trained in the various branches of nursing and equipped for the higher and more responsible positions as well as for practical nursing. She would be as at present under the control of the General Nursing Council.

(2) *The Nursing Assistant**—A woman drawn more often from the elementary than from the secondary schools, and given a practical training of, say, two years mainly in the wards for the chronic sick. She should not be required to pass any entrance or leaving examinations, but should show practical aptitude for this type of work. At the end of the training period she should be given a statement of satisfactory service which would permit her to use the title nursing assistant, but she should not be formally enrolled or admitted to any form of State Register.

33 Such women would be extremely useful in proper conditions and under the direction of a trained staff. They would relieve qualified nurses of much routine work which elsewhere is done by probationers, and indeed they are often much better suited to the inevitable ward drudgery of chronic nursing than a more skilled staff. If at the same time the trained nurses in such hospitals were offered a definitely higher status and better living conditions than the nursing assistant there should not be difficulty in obtaining the trained supervisor needed to safeguard the work of the second grade nurse.

The Tuberculous Nurse

34 This question was discussed at the Ministry of Health by the deputation from the College on November 28, 1935 when it was suggested

(a) that prolonged treatment and after-care be provided for members of the nursing profession who are suffering from tuberculosis, and that local authorities be urged to consider the provision of suitable accommodation and conditions of work under which they may remain as normal members of the community

(b) that nurses in all training schools be medically examined at least once a year to ensure that their physical fitness is maintained.

The College of Nursing also approached the Joint Tuberculosis Council asking them to draw up a list of precautions for the use of nurses in general hospitals when nursing patients suffering from tuberculosis.

35 The Council does not consider that it would be advisable to try to induce local authorities to give preferential treatment facilities to the nurse who is suffering from tuberculosis. The

* This term applies also to assistant nurse referred to in paras 24-5 and is used for convenience but it is not to be interpreted as being a term recommended by the Council.

great majority of local authorities are discharging their responsibilities in this matter to the utmost and it appears to the Council that if any attempt were made to lay down special conditions for the tuberculous nurse, as distinct from other persons for whose treatment the local authority is responsible, difficult questions would be raised. For this reason the Council considers it undesirable that action should be taken on the lines suggested in the Memorandum of the College.

36 A problem of importance and one which needs urgent consideration is the widespread practice under which patients suffering from active pulmonary tuberculosis are treated in general hospitals. This necessarily involves added risk of infection to those in contact with these patients and the Council considers that this is a problem to which attention might well be devoted.

Report of Joint Council of Midwifery

37 In view of the passing of the Midwives Act, 1936, and of the steps which are being taken to apply that Act, the Council desires to make no observations on this part of the memoranda submitted by the College of Nursing.

Summary

1 There should be interchangeability of pension rights for the staffs (including nursing and medical) of council and voluntary hospitals, and any Bill which gives effect to this principle will receive the cordial support of the Association (para 5).

2 Provision should be made for an adequate domestic nursing service which should at present deal only with the type of work now being carried out by the District Nursing Associations—namely domiciliary visiting nursing. The College of Nursing should concentrate upon both the outline and details of such a service (paras 10 and 11).

3 It would be a mistake to couple with any such scheme as is suggested in (2) above, proposals for the control of nursing co-operations. The College of Nursing might formulate model schemes for such bodies (para 11).

4 Accurate information as to the supply and demand for the services of trained nurses is undoubtedly difficult to obtain, and a comprehensive inquiry conducted by the Ministry of Health might furnish useful information on this subject (para 15).

5 Hospital authorities are experiencing great difficulty in obtaining trained nurses for the care of the chronic sick, and the proposal that a second less highly qualified type of nurse is necessary for this work should be examined from a broad point of view. The continued employment of unqualified "nurses" who are under no general professional supervision or control is undesirable. As there is no likelihood of replacing such persons by a fully trained staff it is advisable that their position should be defined and regularized so that the public may readily distinguish between the trained nurse and the unqualified assistant. It seems desirable that the function of (a) the State registered nurse and (b) the nursing assistant, should be clearly differentiated and suggestions are made to this end (paras 19-33).

6 It would be inadvisable to try to induce local authorities to give preferential treatment facilities to the tuberculous nurse in a formal manner although the majority of local authorities are at present discharging their responsibilities in this matter very fully (para 35). Attention might well be devoted to the consideration of the widespread practice under which patients with active pulmonary tuberculosis are treated in general hospitals (para 36).

NATIONAL REGISTER OF MEDICAL AUXILIARIES

A copy of the *National Register of Medical Auxiliary Services* which was reviewed in the *Supplement* of April 24 (p 232) will be sent free and post free to any medical practitioner on application to the Board of Registration of Medical Auxiliaries, Tavistock House (North), 19 Tavistock Square, W.C.1. The Board is anxious that all members of the medical profession shall be acquainted with the aims and objects of the *National Register* and co-operate with it in its efforts to encourage the employment of duly qualified assistants and prevent the exploitation by untrained persons of medical auxiliary work. It is stated that over 3,000 copies of the *Register* have already been issued to medical practitioners, hospitals, and kindred institutions and the auxiliaries themselves. One of its primary purposes is to afford a mutually beneficial means of maintaining contact between registered medical practitioners and duly qualified medical auxiliaries.

THE ORGANIZATION OF THE PROFESSION IN INDIA

REPRESENTATIVE MEETING OF INDIAN BRANCHES AT BOMBAY

The representative meeting of the Indian Branches of the British Medical Association was held at the Grant Medical College on March 4, and among those attending were Dr G C Anderson, Secretary of the British Medical Association, Major S K Engineer and Dr B B Yodh (Bombay), Major Chawla and Dr Agarwal (Lahore), Dr Nayak (Secunderabad), Dr B B Bhatia (Lucknow), Dr Nayar (Madras), and Dr G C Ramsay (Assam and North Bengal). The subject for discussion was the organization of the profession in India, and Dr Anderson opened the proceedings with an account of his impressions of the Indian Branches gained during his three months tour of the country.

After a very full and frank discussion on the work of the Branches in which most of the representatives took part, the following resolutions were passed:

1 That medical men and women registered in the United Kingdom or in the Provincial Medical Registers should be eligible for membership of the Association in India. Where there is no Provincial Register graduates and licentiates should be eligible.

2 That a central office in charge of a part time secretary in a place like Punjab or Delhi which would co-ordinate the work of all the Indian Branches was necessary. This office should be under the control of the president of the representative body for the year.

3 That there should be an annual representative meeting of the Indian Branches at different centres in India. Each Branch should send at least one representative return first-class fare being met from the funds of the Branch.

The meeting was continued on March 5 when there was some discussion concerning the place of the proposed central office. Lahore, Delhi, and Bombay were mentioned, and it was unanimously agreed that Bombay would be the most suitable place. The following resolutions were then passed:

4 That this meeting believes that the Branches would be prepared to forgo a part of the capitation grant (two shillings per head) for the current expenses of the central office. If there is a deficit in any Branch as a result of this it may apply to the Head Office for assistance. Those Branches that have a surplus fund lying with them may be requested by the Head Office to help in the maintenance of this secretariat by voluntary contribution.

5 That in the opinion of this meeting Branches should be encouraged to form as many divisions as possible in their areas.

The meeting closed with a vote of thanks to the Council of the British Medical Association for sending Dr Anderson to study conditions in India, to the Bombay Branch and its representatives Major Engineer and Dr Yodh, for excellent arrangements, and to Lieut-Colonel Bhatia, the dean of the Grant Medical College, for the loan of the staff room for the meeting.

Bombay Branch and the Resolutions

At the annual meeting of the Bombay Branch on April 30 the resolutions of the representative meeting with minor modifications, were approved. The Branch also discussed the recent Government of India proposals for the reorganization of the I.M.S. under the new constitution and passed the following resolutions:

1 The Bombay Branch of the British Medical Association condemns the Government of India's scheme of reorganization

of the I.M.S. under the new constitution and is surprised to find that instead of abolishing the civil side of the I.M.S., as recommended by the services subcommittee of the first R.T.C. the Government have thought fit to perpetuate the civil side and thus hamper the legitimate growth of the medical services in India envisaged by full provincial autonomy

2 The Bombay Branch considers the provision of European I.M.S. officers for the medical treatment of Europeans and their families in the covenanted services a highly objectionable procedure which is derogatory to the self respect of fully qualified and equally competent Indians now available in the bigger centres in India

3 The Bombay Branch is of the opinion that the distinction between the method of selection and nomination of the European and Indian members of the I.M.S. should forthwith be abolished. While considering that the method of open competitive examination was the best till it could be arranged all the officers should be recruited on the same basis without distinction of race

4 The Bombay Branch is further of the opinion that I.M.S. posts on the civil side should only be reserved in those areas where well-qualified medical or specialist aid is not available and that selection of these men should be made on merit only

United Provinces Branch

The meeting of the council of the United Provinces Branch was held at Lucknow on April 19, when Colonel R. S. Townsend was in the chair. Captain Nigam was appointed representative and Lieut.-Colonel Stott delegate to the Annual Meeting to be held at Belfast in July. The resolutions of the representative meeting of the Indian Branches were unanimously approved.

There was some discussion on a letter from the Bombay Branch containing a copy of the latter's resolutions concerning the Government of India's scheme of reorganization of the I.M.S. under the new constitution, the following resolutions were passed

(1) "That this Branch does not approve of the complete removal of the I.M.S. from the civil side and they do protest that the Government found it necessary to reserve certain districts for the European members of the Service"

(2) This Branch also protests against distinctive method of recruitment of the European and Indian members in the I.M.S.

It was decided that a copy of the latter resolution be forwarded to the Bombay Branch for its information

TERRITORIAL ARMY HOSPITALS

PEACE TIME CADRES TO BE FORMED

The War Office announces that it has been decided to form peace time cadres for Territorial Army General Hospitals for home service on similar lines to those which existed before the war. There will be twenty-nine hospital units and these will be distributed between the various Military Commands. Their exact location has not yet been determined in all cases.

The serving personnel for each hospital unit will consist of three officers and twenty four other ranks, who will be members of the Royal Army Medical Corps, Territorial Army. The officers appointed will be the Officer Commanding, a Registrar, and a Quartermaster. The other ranks may be enlisted for home service only, and the upper age limit for enlistment or re-engagement will be 50 years. In addition medical men will be appointed who will constitute the visiting and resident staff on embodiment but who will not be required to do duty in peace.

A further announcement will be made by the War Office when recruiting can begin. In the meantime application should not be made for enlistment into these units.

ESTABLISHMENT OF MEDICAL OFFICERS FOR A TERRITORIAL ARMY GENERAL HOSPITAL (600 Beds—Including 60 for Officers)

PEACE ESTABLISHMENT

Lieutenant-Colonel*	1	Commanding Officer
Major, Captain, or Subaltern	1	Registrar
Quartermaster (non medical)	1	

* Commanding Officer holds the rank of Colonel on embodiment

ESTABLISHMENT ON EMBODIMENT

(i) Visiting Staff (Part-time)			
Physicians	2	Appointed in peace time	Civilian
Surgeons	4	" "	"
Ear, Nose and Throat Surgeon	1	" "	"
Ophthalmic Surgeon	1	" "	"
Anaesthetist	1	" "	"
(ii) Resident Staff (Whole-time)			Nature of Commission
Major	1	Physician	Appointed in peace time
"	1	Surgeon	" "
"	1	Pathologist	" "
"	1	Radiologist	" "
Captain	1	Anaesthetist	" "
Captains or Lieutenants	4	General duties	Post Embodiment
Captain or Lieutenant	1	Dental Surgeon	Appointed in peace time

(iii) Additional Staff on Part time Employment for General Duties

Civilian Medical Practitioners	4	Post-embodiment appointments	Civilian
(May be last year medical students)			

Notes

- 1 Proportionate increases in establishments are authorized as hospitals expand
- 2 Hospitals for the treatment of special cases would have appropriate staffs selected accordingly
- 3 Part time officers to be not less than 50 years of age

TESTING THE EYES

NEW OPHTHALMIC BENEFIT REGULATIONS

We publish below a letter which the Minister of Health Sir Kingsley Wood has addressed to Sir Francis Fremantle concerning the new ophthalmic benefit regulations. It will be remembered (SUPPLEMENT June 12 p 373) that in those regulations the Minister proposes among other things to give statutory recognition to the examination of the eyes by sight testing opticians. We also publish the comments of the Medical Secretary of the British Medical Association on the Minister's letter.

Ministry of Health
Whitehall S.W. 1
June 1937

My dear Fremantle,

You will remember that when I met a deputation from the Medical Committee of the House of Commons on the subject of the new regulations governing ophthalmic benefit under the National Health Insurance scheme I promised that I would send you a letter which could if the committee so desired be published, making clear the position as explained to the deputation.

It is, I think, accepted even by those who most dislike the regulations that under present conditions in this country it is not possible to insist that insured persons obtaining glasses must do so on the prescription of a medical man and, that consequently the regulations must admit of payment being made by approved societies to sight-testing opticians. I had hoped that it would be possible to word the regulations in such a way as to meet the representations of the medical profession, and the draft regulations first published were worded accordingly. These regulations were, however, challenged, and, after taking the highest legal opinion available to me, there was no option but to retain in the regulations certain words referring to services rendered by an optician incidental to the provision of an optical appliance to which objection had been taken but which had been there since 1930.

This change should not be taken to mean that I have departed in any way from the opinion which I have already expressed on many occasions that if the services of a medical eye specialist are available any person suffering from eye trouble would be well advised if in a position to do so, to avail himself of such services and I should be glad to see this opinion grow, as I think it is growing among the people of this country. This is evidenced by the increasing use which is being made of the service provided by the National Ophthalmic Treatment Board which now covers many parts of the country. I am, however, compelled to have regard to the practical position at the present time and until it can be said that medical specialist treatment is always and everywhere possible and available it is my duty to make provision for whatever other treatment can now be given.

From what was said when I met you and from the correspondence published in the press, it seems that it is not generally understood that an insured person cannot obtain ophthalmic benefit until he has, as a first step, been examined by his own insurance doctor. Moreover, the new regulations expressly provide that every person claiming ophthalmic benefit shall be informed of his right to go to a medical eye specialist if he so desires whether that is the normal arrangement made by his society or not.

As regards the list of opticians to be drawn up by the new committee to be appointed under the regulations I wish to make it clear that the object of this list is to enable approved societies to have a list of persons to whom members can go for the purposes of obtaining glasses. The list will be described as a list of opticians recognized by the committee for the purpose of the supply of optical appliances to insured persons.

Finally, I would emphasize that under the new regulations there should not be any setback whatever to the progress of useful schemes for a service of medical eye specialists working in co-operation with qualified opticians. Indeed, I would venture to express the hope that the medical profession may see their way to co-operate with the new committee to be set up under the regulations so as to secure a satisfactory and constantly improving service for the insured population, and I trust that with this object in view they will be able to nominate one or more representatives to serve on the new committee.

Yours sincerely,

KINGSLEY WOOD

Comments of the Medical Secretary

The Association agrees that it is desirable to ensure that persons in receipt of ophthalmic benefit shall obtain their glasses from reputable opticians. It is also agreed that insured persons should have the right to exercise their freedom to decide whether their eyes shall be examined by a medical practitioner or an optician. Provision can be made for both these, however, without the Minister recognizing the practice of sight testing by anyone who has not had a medical training. This is the essence of the Association's objection to the Amending Regulations. Under the 1930 Regulations the selection of opticians for the purposes of ophthalmic benefit rested with the individual approved society, it is now to be within the discretion of a special committee appointed by the Minister. This fact, together with the reference in the Amending Regulations to the inclusion of a scale of charges to be drawn up by the approved committee, "which scale may include as a separate item any charge for a service rendered by an optician whether an optical appliance is supplied or not," means recognition by the Minister of the practice of sight testing by opticians which in the opinion of the Association, is not in the public interest.

The Minister suggests that one of the main reasons for his present action is the paucity of ophthalmic surgeons. The Association challenges this contention. It is able to produce a list of approximately 1,000 medical practitioners who have received special training in ophthalmology and who are willing to provide a service to suit the economic needs of those for whom the Minister is making these regulations. This list could be extended in a very short time if the work were available. The Minister emphasizes that an insured person claiming ophthalmic benefit has the right to go to a medical eye specialist if he so desires, but he omits to say that little or no encouragement is given to insured persons to seek that advice and that unless the right is exercised at the time of application for ophthalmic benefit the insured person must follow the instructions of his society, which means, in the vast majority of cases, that he will receive an examination from a sight testing optician.

The Minister says that, acting on legal advice, he has no option but to retain in the regulations a reference to services rendered by an optician incidental to the provision of an optical appliance. It is doubtful, however, whether legal opinion is so definite on this point as to make it obligatory upon the Minister to succumb to the pressure of the sight testing opticians. It is satisfactory to note that the Minister is wholeheartedly of opinion that any person suffering from eye trouble would be well advised to avail himself of the services of a medical eye specialist but it is very disappointing to find him making regulations which will be likely to have the opposite effect. The claim of sight-testing opticians as diagnosticians will be strengthened, and it will be increasingly difficult to educate the public in the way that the Minister would have us believe he wishes people to be educated.

June 23 1937

DENTAL BENEFIT

DEPUTATION TO THE MINISTER OF HEALTH

The following official report has been received for publication

Sir Kingsley Wood the Minister of Health who was accompanied by Mr Bernays the Parliamentary Secretary to the Ministry of Health recently received a deputation representing the British Dental Association the Incorporated Dental Society and the Public Dental Service Association. The deputation consisted of Mr Bryan J Wood Mr W J Senior Mr R G Heegaard Warner Mr C H Oliver Mr A. H. Condon Mr H Parker Buchanan Mr F J Ballard and Professor Gilmour and the chief spokesman was Mr Bryan J Wood.

The deputation referred to the effect of dental defects and disease upon the health of all classes of the community and emphasized the need for a comprehensive dental service as an essential sequel to the school dental service which would provide dental inspection and treatment for every insured person. This could only be made possible by means of a statutory dental benefit. The service should be organized on a panel system similar to that in force for medical benefit and the dentists like the insurance medical practitioners should be remunerated on a capitation basis.

Sir Kingsley Wood said in reply that over 10 million persons—two-thirds of the whole insured population of England and Wales—were already entitled to dental treatment as an additional benefit and that the scope of the existing scheme would be considerably extended by the new proposals for bringing juveniles into National Health Insurance. It was clear that the cost of providing dental benefit as a statutory benefit would be very heavy and it would of course raise the question of an appropriate increase in the rates of contribution at present paid by insured persons and their employers. Important considerations were involved by the suggestion that dentists should be remunerated on a capitation basis.

Sir Kingsley Wood said he was much impressed by the representations which the deputation had made and promised to give them his careful consideration.

Correspondence

INSURANCE CAPITATION FEE

SIR—May I congratulate you on the excellence of your leader on the capitation fee in the *Journal* of June 12. Nothing so cogent has appeared in your columns in my time. For there emerged at the inquiry points which as you so properly point out were profoundly disquieting. The evidence given by one of the medical officers must have appalled the profession. It is impossible to believe that that evidence represents the real view of the Ministry of Health. If it does not and had not the approval of the Ministry why was it allowed to be given? If it does reveal the real opinion of officialdom regarding our N.H.I. work the outlook is black indeed. To some of us who have been working the N.H.I. Act since its inception that opinion seems nothing less than a gross libel.

Who steals my purse steals trash
But he who filches from me my good name

—I am etc.,

Edinburgh June 12.

J. K. WELSH

SIR—As a member of the British Medical Association of long standing I was pained to read the penultimate paragraph of your editorial comments on the recent inquiry regarding the capitation fee for insurance practitioners (*Journal* June 12 p. 1211). This paragraph contained a reflection on the bona fides of members of our profession who are quite unknown to me but who had given evidence at that inquiry and who had been subjected as I gather from your report of the

proceedings to an able and searching cross-examination by my friend Dr Dain who was also allowed to call rebutting evidence. Surely the matter should have been allowed to rest there seeing that their position as civil servants prevents the gentlemen whom you have pilloried from making any statement in their own defence—I am etc.

Harrogate June 14

ADAM FULTON

SIR—The thanks of the profession are due to Dr Dain for the able way he conducted the case for an increase in the capitation fee and also to Drs Anderson and Hill for the fair way it was presented. The profession will be more than disappointed. We were let down in statements made in support of the Ministry. More unfair and stupid statements by medical men have never been heard by the colleagues of these men before. Dr Dain did all he could to refute this evidence but the Court of Inquiry believed their statistics and ridiculous opinions of medical practice. Our statistics could not have been believed. Never again a Court of Inquiry. We must make a real stand and say: A 10s. capitation fee we must have or resign. The best line of defence is attack. I am too old to lead but surely there is some younger man on the Insurance Acts Committee. Let him come forward and be up and doing.—I am etc.

Birmingham June 15

F. A. L. BURGESS

SIR—I would like to join with Dr Flemming in appreciation of your admirable leading article on the findings of the Court of Inquiry into the insurance capitation fee. That the Ministry of Health is out of touch with medical practice, or rather out of touch with all but one type of medical practice was shown by its own statements and witnesses. The type of practice Dr Furness outlines is by no means exceptional but the Ministry does not recognize it in its estimates and though Dr Furness has every reason to demand some encouragement, he will never get it. To read the biased and extraordinary evidence of the deputy regional medical officers and others an impartial observer would be led to think that the modern improvements in diagnosis and treatment had not affected the general practitioner at all. It is a moot question to me whether the insurance practitioner should do the work in the type of practice mentioned by Dr Furness or whether he should confine himself strictly to his agreement of "general practitioner" services only. It is probably a question each doctor will have to answer himself but judging by the evidence of the Ministry at the Court of Inquiry he will get no thanks for doing his work well nor any recognition for it—I am etc.

Surrey June 21

RALPH G. SMITH

SIR—In reply to Dr C. E. S. Flemming's letter (*Supplement* June 19 p. 401) there are a few points which he makes that will certainly not find favour with most of us younger practitioners who have still many years of national health insurance practice before us. He says "No one has I presume any wish to dispute the justice of the findings of the Court on the evidence put before it. I still very definitely dispute this so-called justice. Secondly he says 'The evidence of the approved societies showed none of that animus and a more real appreciation of the quality and character of the work done by panel practitioners.' In the evidence given Mr Duff says 'The approved societies were satisfied that the opinion expressed in the Ministry's memorandum that a case existed for a reduction in the capitation fee on the grounds set out and to the extent there mentioned were well founded' (*Supplement* June 5 p. 356). This may not be animus but it is certain that although the approved societies are not our bitter enemies they are still our enemies in this matter.

There are other lessons to be learned from the result of this Court of Inquiry. The first of these is that the Minister of Health has no use for the general practitioner although when he requires his help he will say nice things about him, leave him purring with pleasure and then go back and with the politician's code of honour to ease his conscience promote

legislation to take some more of the general practitioner's work from him or reduce the remuneration for the work he already does. Secondly there is to be no reward for work well done. The Ministry apparently is content if the regulations and terms of service are satisfied. It is prepared to pay no more for a service which is really good than one which merely fulfils our contract with the Government and all of us in practice know what a vast difference there is between the two.

I suggest that the fight must continue and if the Minister will not be reasonable, then we must give him just that service for which he pays. We must put our own house in order with regard to the keeping of records of all 'A's and 'V's,' for on these alone must our remuneration depend in future. We must remember that the figures quoted by the Ministry were from records which we keep so badly and if on the next occasion these figures are quoted we must make sure that they are accurate, and so all 'A's and 'V's' must be entered.

It is impossible to find suitable words to express our admiration for Dr. Dain not only in the way he worked for us at the Court of Inquiry but for his preparation of the case beforehand. I am sure that any panel doctor in this country will say a very heartfelt "thank you" to him and to the secretariat. Failure is not defeat but learning how—I am, etc.,

Birmingham June 21

ARTHUR BEAUCHAMP

OPHTHALMIC BENEFIT

SIR—The Minister of Health appears to be determined to enforce his Additional Benefits Amendment Regulations 1937 and so recognize certain opticians as fit not only to prescribe glasses but to diagnose ophthalmic disease. This in spite of expert medical opinion and advice to the contrary and of his previous failure to enact by legislation.

Should and when the proposed Regulations become operative the principal reason, no doubt, will be that the Minister is convinced that it is in the public interest that the opticians concerned should be and are well able to recognize ophthalmic disease when they see it. If that be so and the opticians themselves loudly protest that it is no objection can be raised by anyone—least of all the opticians—to compulsory notification of all diseases of the eyes which come before them. This would serve three useful purposes: (1) It would promote the welfare of those members of the approved societies and others who may not have been aware that they were suffering from such complaints as, for example, glaucoma, optic atrophy, retinitis, detached retina or neoplasm. (2) It would test the bona fides of the opticians. (3) It would greatly assist in the compilation of the incidence of ophthalmic disease on a vastly extended scale—hitherto impossible of attainment—the importance of which is obvious. I cannot conceive of objection being seriously taken by the examinees of the approved societies or the opticians for it would be to the advantage of all concerned—I am, etc.,

London W.2 June 15

R. GALWAY MURRAY

Naval, Military, and Air Force Appointments

ROYAL NAVAL MEDICAL SERVICE

Surgeon Captain P. L. Gibson to the *Pembroke* for Royal Naval Barracks.

Surgeon Commander E. B. Pollard to the *Pembroke* for Royal Naval Barracks.

Surgeon Lieutenant H. E. B. Currel to be Surgeon Lieutenant Commander.

Surgeon Lieutenant C. J. Mullen to the *Pembroke*.

ARMY MEDICAL SERVICES

Colonel J. Healy Spencer CBE, late R.A.M.C. having attained the age for retirement has been placed on retired pay.

Lieut.-Col. W. H. O'Riordan M.C. from R.A.M.C., to be Colonel with seniority December 20, 1936.

ROYAL ARMY MEDICAL CORPS

Major G. S. McConkey to be Lieutenant Colonel.

ROYAL AIR FORCE MEDICAL SERVICE

Flight Lieutenant H. C. S. Pimblett to be Squadron Leader.
Flight Lieutenants W. G. S. Roberts to R.A.F. Station Dhubban, Iraq; H. E. Bellinger to R.A.F. General Hospital, Iraq; Hinaidi W. J. L. Dean to No. 84 (Bomber) Squadron, Shaibah, Iraq; G. H. J. Williams to No. 6 Flying Training School, Netheravon.
The following Flying Officers are to be Flight Lieutenants with seniorities in parentheses: J. R. R. Jenkins (May 4, 1936); E. W. R. Fairley (November 10, 1936); S. G. Gordon (November 23, 1936).

Flying Officer R. C. O. Grady to be Flight Lieutenant.

AUXILIARY AIR FORCE MEDICAL BRANCH

J. H. Altwood to be Flying Officer.

MILITIA

ROYAL ARMY MEDICAL CORPS

Major S. R. Armstrong, O.B.E., has relinquished his commission and retained his rank of Major.

TERRITORIAL ARMY

ROYAL ARMY MEDICAL CORPS

Captain G. L. Pillans M.C. has resigned his commission and retained his rank.

Lieutenant W. Bruce, from 6th Battalion Gordons to be Captain with seniority May 1, 1934.

T. G. Armstrong late Cadet, Felseld School Contingent Junior Division O.T.C. to be Lieutenant.

INDIAN MEDICAL SERVICE

Colonel H. C. Buckley to be Major-General.

Lieut.-Col. J. F. James has retired from the Service.

Captain M. H. Shah has been appointed temporarily as Civil Surgeon, New Delhi.

Captains T. R. Pahwa M.A. Gaffar M. Hafizuddin Gopal Singh K. L. Malhaura and K. V. R. Choudari have relinquished their temporary commissions.

Lieutenant A. Haq has relinquished his temporary commission.

British Medical Association

ANNUAL REPRESENTATIVE MEETING, BELFAST, 1937

The Annual Representative Meeting of the British Medical Association will be held in the Assembly Hall, Assembly Buildings, Fishervick Place, Belfast, on Friday, Saturday, Monday, and Tuesday, July 16, 17, 19 and 20, 1937.

RESOLUTIONS BY DIVISIONS AND BRANCHES FOR THE REPRESENTATIVE BODY

IMMUNIZATION FOR DIPHTHERIA

Motion BY CAMBERWELL. That (with reference to para 103 of the Annual Report of Council) the Council be instructed to consider an appropriate scale of fees to be paid by the local authority to practitioners doing immunization work having regard to the varying number of attendances involved in the different immunizing methods in use at the present day.

PUERPERAL PYREXIA AND FEVER

Motion BY CUMBERLAND. That where a medical practitioner furnishes information by means of a questionnaire to local health authorities in connexion with investigations into cases of puerperal pyrexia or fever a fee should be payable for completing the questionnaire.

VOLUNTARY HOSPITALS COMMISSION

Motion BY EXETER. That (with reference to para 182 of the Supplementary Report of Council) the Representative Body expresses its warm approval of the main principles recommended by the Commission appointed by the British Hospitals Association in its Report published April 1937, and urges the Council to do all in its power by co-operation with that Association and otherwise to secure that those recommendations be implemented.

DENTAL BENEFIT REGULATIONS

Amendment BY SUNDERLAND. That (with reference to para 83 of the Annual Report of Council) the fee for all general anaesthetics administered for dental should be one guinea.

Annual Dinner and Dance

Owing to the large number of members unable to obtain seats at the Annual Dinner and Dance on Thursday, July 22, the Dinner Committee have decided to issue a limited number of tickets for the dance only. These will entitle holders to admission to the dance following the Annual Dinner, at 10.30 p.m. The price of each ticket is 5s. Early application for these tickets is advised, as their number is limited.

Branch and Division Meetings to be Held

BORDER COUNTIES BRANCH—At Cumberland Infirmary, Carlisle, Thursday July 8 3.30 p.m. Annual general meeting. Election of officers etc. Presidential address B.M.A. Annual Meeting at Melbourne Australia.

LINCOLNSHIRE BRANCH LINCOLN DIVISION—At North Kesteven Rural District Council Offices Clasketgate, Lincoln, Wednesday June 30 3 p.m. Annual general meeting. Election of officers etc.

METROPOLITAN COUNTIES BRANCH—At B.M.A. House Tavistock Square W.C. Friday July 2, 4 p.m. Eighty-fifth annual general meeting. Agenda Report of Branch Council and financial statement report of representatives of Branch on Central Council report as to election of officers for 1937-8, presidential address by Dr. William Paterson Preventive Medicine and the General Practitioner.

METROPOLITAN COUNTIES BRANCH CITY DIVISION—At Metropolitan Hospital Kingsland Road E. Wednesday June 30 9.30 p.m. Annual general meeting. Election of officers Dr. V. Freeman Maternity and Child Welfare Services in Islington.

METROPOLITAN COUNTIES BRANCH KENSINGTON DIVISION—At Kensington Town Hall Friday June 25 8.45 p.m. Dr. Henry Wilson The Approach to the Neurotic At British Post-Graduate Medical School Monday June 28 8.30 p.m. Lecture and demonstration on air raid precautions by Colonel J. Mackenzie Home Office Medical Instructor for the London Centre.

METROPOLITAN COUNTIES BRANCH NORTH MIDDOLESEX DIVISION—Thursday July 1 Summer meeting.

METROPOLITAN COUNTIES BRANCH WEST MIDDOLESEX DIVISION—Tuesday June 29 9 p.m. Meeting to instruct representative at the Annual Representative Meeting.

NORFOLK BRANCH—At Overstrand Thursday July 8 Annual meeting.

SOUTHERN BRANCH PORTSMOUTH DIVISION—Thursday July 1 Meeting to instruct representatives.

SOUTH WESTERN BRANCH—At Royal Devon and Exeter Hospital Wednesday July 7 3 p.m. Annual meeting. Election of officers etc. Inaugural address by Dr. F. W. Morton Palmer The Progress of Medicine in Thirty-five Years 7.30 p.m. Dinner at the Royal Clarence Hotel.

WILTSHIRE BRANCH—At Devizes Mental Hospital Wednesday June 30 3 p.m. Annual meeting. Election of officers etc. Miss Margaret Bond Maternity and Child Welfare in Central Africa.

YORKSHIRE BRANCH—At Royal Bath Hospital Harrogate Saturday June 26 3 p.m. Annual meeting. Election of officers. Presidential address by Dr. Geoffrey Holmes Menopausal Arthritis Demonstration of plaster work by Mr. T. Vibert Pearce 6 p.m. Tour of the Royal Baths 8 p.m. Dinner and Dance at the Hotel Majestic.

YORKSHIRE BRANCH SHEFFIELD DIVISION—At Church House St. James Street Sheffield Friday July 2 8.30 p.m. Consideration of Annual Report of Council etc.

POST-GRADUATE COURSES AND LECTURES

JULY

The following post graduate courses and lectures, to be held in London during July have been notified to the British Medical Association. Further particulars may be obtained direct from the hospitals concerned or in the case of arrangements made by the Fellowship of Medicine (F.M.), from the Secretary of the Fellowship, 1, Wimpole Street, W.1.

Subject	Date	Place of Meeting	Nature of Instruction
Dermatology	July 12-24	Hospital for Diseases of the Skin Blackfriars	F.M. course including two special demonstrations
Heart and Lungs, Diseases of	July 3-4	City of London Hospital for Diseases of the Heart and Lungs, Victoria Park, E.2	F.M. week end course
Medicine and Surgery	July 10-11	Miller General Hospital Greenwich Road S.E.10	F.M. week end course
Proctology	July 5-10	St. Mark's Hospital for Diseases of the Rectum City Road E.C.1	F.M. course of lectures and demonstrations
Urology	July 12-30	All Saints Hospital Austral Street, West Square S.E.11	F.M. course of clinical and cystoscopic demonstrations

POST-GRADUATE NEWS

The Fellowship of Medicine announces the following courses: proctology at St. Mark's Hospital, July 5 to 10; dermatology at Hospital for Diseases of the Skin Blackfriars S.E., July 12 to 24; urology at All Saints Hospital July 12 to 31; heart and lung diseases at Victoria Park Hospital July 3 and 4; general medicine and surgery at Miller General Hospital July 10 and 11. A special demonstration on the fundus oculi intended for M.R.C.P. candidates will be given on Tuesday, July 6 at 8.30 p.m. Courses are open only to members of the Fellowship of Medicine (1 Wimpole Street, W.)

WEEKLY POST-GRADUATE DIARY

BRITISH POST-GRADUATE MEDICAL SCHOOL Ducane Road, W.—Daily 10 a.m. to 4 p.m. Medical Clinics Surgical Clinics and Operations Obstetrical and Gynaecological Clinics and Operations Tues 4.30 p.m. Dr. D. Hunter Occupational Diseases Wed 12 noon Clinical and Pathological Conference (Medical), 2 p.m. Dr. Belt Pathology of Pneumomonocytosis 3 p.m. Clinical and Pathological Conference (Surgical) Thurs 2.15 p.m. Dr. Duncan White, Radiological Demonstration 3 p.m. Operative Obstetrics Fri 3 p.m. Clinical and Pathological Conference (Obstetrics and Gynaecology)

FELLOWSHIP OF MEDICINE AND POST-GRADUATE MEDICAL ASSOCIATION 1 Wimpole Street W.—West End Hospital for Nervous Diseases Welbeck Street W. Afternoon M.R.C.P. Course in Neurology City of London Hospital Victoria Park, E. Wed and Fri, 6 p.m., M.R.C.P. Course in Heart and Lung Diseases Sat and Sun, Course in Heart and Lung Diseases Brompton Hospital S.W. Twice weekly 5 p.m. M.R.C.P. Course in Chest Diseases Preston Hall near Maidstone All-day Tuberculosis Demonstrations for M.R.C.P. candidates

HOSPITAL FOR SICK CHILDREN Great Ormond Street W.C.—Thurs 2 p.m. Clinical Lecture Dr. Robert S. Frew Enuresis 3 p.m. Clinical Pathological Lecture Dr. W. W. Payne Control of Obesity Out patient Clinics mornings 10 a.m. to 12 noon Ward Visits afternoons 2 p.m. to 3.30 p.m.

ST. PAUL'S HOSPITAL Endell Street W.C.—Wed 4.30 p.m., Mr. Claude H. Mills Some Interesting Urological Cases, with demonstrations of pathological specimens and radiographs

SOUTH WEST LONDON POST-GRADUATE ASSOCIATION St. James Hospital Ouseley Road Balham, S.W.—Tues 4 p.m. Mr. J. P. Monkhouse Hearing Aids

DIARY OF SOCIETIES AND LECTURES

ROYAL SOCIETY OF MEDICINE

Section of Psychiatry—Tues., 8.30 p.m. Annual General Meeting Election of Officers and Council for 1937-8 Paper by Dr Erich Wittkower Influences of the Emotions on Bodily Function

Section of Comparative Medicine—Wed. 4.30 p.m. Laboratory Meeting at National Institute for Medical Research Farm Laboratories, Mill Hill NW Demonstrations by Dr C H Andrews Dr Stuart Harris and Dr Wilson Smith Current Investigations in Influenza Dr A S Parkes and Mr C W Emmens, Endocrine Studies in Poultry Dr Wilson Smith Technique of Egg Inoculation for Virus Culture Miss E Salmon Sexing of Day-old Chicks

VACANCIES

All advertisements should be addressed to the Financial Secretary and Business Manager and NOT to the Editor

- ASHFORD HOSPITAL.—R.M.O. (male, unmarried) Salary £150 p.a.
ASHTON UNDER LYNE DISTRICT INFIRMARY.—(1) Casualty H.S. (male) (2) H.S. Salaries £180 p.a. and £150 p.a. respectively
BARNESLEY BECKETT HOSPITAL AND DISPENSARY.—(1) J.H.S. (2) H.S. Salary £200 p.a.
BARROW IN FURNESS NORTH LONSDALE HOSPITAL.—R.C.O. (male) Salary £150 p.a.
BARRY URBAN DISTRICT COUNCIL.—R.S.O. for the Accident and Surgical Hospital Salary £350-£50-£450 p.a.
BARRY URBAN DISTRICT AND PORT.—Deputy M.O.H. Deputy Port M.O., and Assistant School M.O. (male) Salary £600-£25-£700 p.a.
BATH ROYAL UNITED HOSPITAL.—(1) H.S. for General Surgery and Ear, Nose, and Throat (2) H.S. for the Gynaecological and Obstetric Department Males unmarried Salaries £150 p.a. each (3) Hon. Assistant to Fracture Service (4) H.P. (male unmarried) Salary £150 p.a.
BIRMINGHAM GENERAL HOSPITAL.—H.S. to the Throat and Ear Department
BIRMINGHAM AND MIDLAND EYE HOSPITAL.—H.S. Salary £130-£150 p.a.
BIRMINGHAM MIDLAND HOSPITAL.—H.S. Salary £200 p.a.
BIRMINGHAM QUEEN'S HOSPITAL.—Resident Anaesthetist Salary £70-£100 p.a.
BLACKPOOL VICTORIA HOSPITAL.—H.P. (male) Salary £200 p.a.
BOLINGBROKE HOSPITAL Wandsworth Common SW.—H.P. (male, unmarried) Salary £120 p.a.
BOLTON COUNTY BOROUGH.—A.M.O. (male) for Townley's Hospital Farnworth Salary £225 p.a.
BRADFORD ROYAL EYE AND EAR HOSPITAL.—Two H.S.s (females). Salaries £180 p.a. each
BRIGHTON T.F.W. SUSSEX HOSPITAL FOR WOMEN.—(1) H.S. (2) H.P. Females Salaries £100 p.a. each
BRIGHTON ROYAL SUSSEX COUNTY HOSPITAL.—Casualty H.S. (male) Salary £120 p.a.
BRISTOL ROYAL HOSPITAL FOR SICK CHILDREN AND WOMEN.—Hon. P. to Out patient Department
BURY INFIRMARY.—(1) R.S.O. (male) Salary £300-£350 p.a. (2) C.O. (male) Salary £150 p.a.
BUXTON DEVONSHIRE ROYAL HOSPITAL.—H.P. (male) Salary £150-£175 p.a.
CAMBERWELL METROPOLITAN BOROUGH.—Tuberculosis Officer and Deputy M.O.H. Salary £750-£937 10s. p.a.
CAMBRIDGE ADDENBROOKE'S HOSPITAL.—Resident Anaesthetist and Emergency Officer (male, unmarried) Salary £130 p.a.
CAROIFF KING EDWARD VII WELSH NATIONAL MEMORIAL ASSOCIATION.—R.M.O. (male, unmarried) Salary £350 p.a.
CARLISLE CUMBERLAND INFIRMARY.—H.S. (male) for the Special Departments Salary £155 p.a.
CHARING CROSS HOSPITAL W.C.—(1) Hon. Orthopaedic S. (2) Hon. Clinical Assistant to the X-Ray and Electrotherapeutics Department
CHESTERFIELD AND NORTH DERBYSHIRE ROYAL HOSPITAL.—H.S. (male) Salary £150 p.a.
CHESTER SOUTH WEST CHESHIRE JOINT COMMITTEE.—M.O.H. for the Rural Districts of Chester and Tarvin Salary £800 p.a.
CHICHESTER ROYAL WEST SUSSEX HOSPITAL.—J.H.S. Salary £125 p.a.
COVENTRY AND WARWICKSHIRE HOSPITAL.—(1) H.P. Salary £160 p.a. (2) R.H.S. (3) C.O. Salaries £150 p.a. each
CROYDON COUNTY BOROUGH.—Assistant M.O.H. and Assistant School M.O. (male) Salary £500-£25 £700 p.a.
DARLINGTON MEMORIAL HOSPITAL.—H.S. Salary £150 p.a.
DURHAM COUNTY MENTAL HOSPITAL.—Locumtenent A.M.O. Salary £1 1s. per day
EASTBOURNE ROYAL EYE HOSPITAL.—Non resident H.S. Salary £175 p.a.
FAREHAM KNOWLE MENTAL HOSPITAL.—J.A.M.O. (male unmarried) Salary £350-£25 £450 p.a.
GLOUCESTER GLOUCESTERSHIRE ROYAL INFIRMARY AND EYE INSTITUTION.—(1) H.S. (2) H.P. Males Salaries £150 p.a. each
GUILDFORD ROYAL SURREY COUNTY HOSPITAL.—H.S. (male) Salary £150 p.a.
HALIFAX ROYAL HALIFAX INFIRMARY.—First H.S. (male unmarried) Salary £200 p.a.
HERTFORD COUNTY HOSPITAL.—H.S. (male) Salary £180 p.a.
HOSPITAL FOR CONSUMPTION AND DISEASES OF THE CHEST Brompton, S.W.—(1) Three H.P.s (2) H.P. (male) for the Sanatorium at Frimley Honorariums £50 p.a. each
HOSPITAL OF ST JOHN AND ST ELIZABETH Grove End Road NW.—R.H.P. (male) Salary £100 p.a.
HOSPITAL FOR SICK CHILDREN Great Ormond Street, W.C.—R.M.O. (unmarried) for the Country Branch Hospital, Tadworth Salary £250 p.a.
HOSPITAL FOR TROPICAL DISEASES Gordon Street W.C.—Ophthalmic S.
HUDDERSFIELD COUNTY BOROUGH.—R.M.O. for St Luke's Hospital Salary £230 p.a.
HULL CORPORATION.—A.M.O.s for the Beverley Road Institution Salaries £350 p.a. each
HULL ROYAL INFIRMARY.—(1) Second H.P. (2) H.S. Males Salaries £150 p.a. each
ILFORD BOROUGH.—(1) Assistant M.O.H. (male) (2) Assistant M.O.H. (female) Salaries £400-£25-£700 p.a. and £400-£25 £550 p.a. respectively
ILFORD WEST HAM MENTAL HOSPITAL Goodmayes.—J.A.M.O. (male unmarried) Salary £350-£25 £450 p.a.
IPSWICH EAST SUFFOLK AND IPSWICH HOSPITAL.—(1) C.O. (2) H.S. to the Orthopaedic and Fracture Department (3) H.S. to a General S. (4) Genito-urinary S. Males Salaries £144 p.a. each
KEIGHLEY AND DISTRICT VICTORIA HOSPITAL.—R.M.O. Salary £180 p.a.
KETTERING AND DISTRICT GENERAL HOSPITAL.—H.S. and H.P. (male) Salary £160 and £140 p.a. respectively
KING'S COLLEGE HOSPITAL, Denmark Hill S.E.—Assistant Neurologist
KING'S LYNN WEST NORFOLK AND KING'S LYNN GENERAL HOSPITAL.—H.P. Salary £125 p.a.
KINGSTON-ON-THAMES SOUTH MIDDLESEX AND RICHMOND JOINT HOSPITAL BOARD.—A.R.M.O. for Mogden Fever Hospital Isle worth
LEEDS CITY.—A.R.M.O. (male, unmarried) for Killingbeck Sanatorium Salary £250 p.a.
LONDON CHEST HOSPITAL Victoria Park E.—Assistant Tuberculosis Officer Salary £600-£25 £700 p.a.
LONDON COUNTY COUNCIL.—(1) Part time Consulting Dermatologist (2) Temporary District M.O. for Area IV (Hampstead) District A Salaries £125 p.a. and £120 p.a. respectively (3) Senior A.M.O.s (Grade II) for (a) Colindale Hospital N.W., (b) High Wood Hospital for Children, Brentwood Salaries £500-£25-£600 p.a. each (4) A.M.O. (Grade I) for King George V Sanatorium, Godalming Salary £350-£25 £425 p.a. Unmarried
LOUTH AND DISTRICT HOSPITAL.—(1) Hon. Consulting Orthopaedic S. (2) Hon. Consulting P.
MANCHESTER ANCOATS HOSPITAL.—H.S. to the Ear, Nose and Throat Department. Salary £100 p.a.
MANCHESTER CITY.—(1) Assistant Pathologist (non resident) for Crumpsall Pathological Laboratory Salary £500 £25 £700 p.a. (2) R.A.M.O. for Withington Hospital Salary £200 p.a.
MANCHESTER EAR HOSPITAL.—R.H.S. Salary £120 p.a.
MANCHESTER NORTHERN HOSPITAL.—(1) R.S.O. Salary £150 p.a. (2) R.H.P. (3) R.H.S. Salaries £100 p.a. each
MANCHESTER ROYAL MANCHESTER CHILDREN'S HOSPITAL.—(1) R.M.O. (unmarried) (2) R.H.S. Salaries £150 p.a. and £100 p.a. respectively
MANCHESTER AND DISTRICT GENERAL HOSPITAL.—H.S. (male) Salary £150 p.a.

MARIE CURIE HOSPITAL Fitzjohns Avenue NW—Assistant Director Salary £500 p.a.

MENBOROUGH MONTAGU HOSPITAL—R.H.S. (female) Salary £120 p.a.

MIDDLESBROUGH NORTH ORMESBY HOSPITAL—H.S. (male) Salary £5 5s per week.

MIDDLESBROUGH NORTH RIDING INFIRMARY—(1) Senior H.S. (2) Third H.S. Males unmarried Salaries £175 p.a. and £140 p.a.

MIDDLESEX COUNTY COUNCIL—(1) A.M.O. and (2) J.R.A.M.O. for North Middlesex County Hospital, Edmonton Salaries £350 p.a. and £250 respectively (3) Visiting Dental S for West Middlesex County Hospital Isleworth Salary £2 2s per session (4) Non resident S (Grade 1) and (5) Assistant Pathologist for West Middlesex County Hospital Isleworth Salaries £1 000 £50-£1 500 p.a. and £650 £25 £800 p.a. respectively (6) Senior Dental Officer Salary £700-£25 £900 p.a.

NEWCASTLE UPON TYNE HOSPITAL FOR SICK CHILDREN—(1) H.P. (2) H.S. Salaries £100 p.a. each (3) Anaesthetist Fee £1 1s per session.

NEWCASTLE UPON TYNE ROYAL VICTORIA INFIRMARY—Assistant Radium Officer (non resident) Salary £350 p.a.

NORWICH INFIRMARY—R.A.M.O. Salary £350-£25 £450 p.a.

NORWICH NORFOLK AND NORWICH HOSPITAL—(1) General H.S. (2) H.S. to the Orthopaedic Department (3) C.O. Males unmarried Salaries £120 p.a. each.

NOTTINGHAM GENERAL HOSPITAL—(1) H.S. to the Ear Nose and Throat Department (2) R.C.O. (male) Salaries £150 p.a. each.

OLDHAM COUNTY BOROUGH—R.A.M.O. (unmarried) for the Municipal Hospital Salary £200 p.a.

OXFORD RADCLIFFE INFIRMARY—R.M.O. Salary £120 p.a.

PLYMOUTH PRINCE OF WALES'S HOSPITAL Greenbank Road—(1) H.S. (2) H.P. Salaries £120 p.a. each.

PLYMOUTH PRINCE OF WALES'S HOSPITAL Devonport—J.H.S. Salary £120 p.a.

PORT-OF-SPAIN CITY—Medical Officer of Health Salary £800-£25 £1,000 p.a.

PORTSMOUTH CITY MENTAL HOSPITAL—Locumtenent A.M.O. (male) Salary £7 7s per week.

QUEEN MARY'S HOSPITAL FOR THE EAST END E—(1) Casualty and Out patient Officer (unmarried) Salary £150 p.a. (2) Surgical Anaesthetist Honorarium £52 10s. p.a.

QUEEN'S HOSPITAL FOR CHILDREN Hackney Road E—Visiting Anaesthetist Fee £1 15s per attendance.

ROTHERHAM HOSPITAL—H.S. for the Ophthalmic and Ear Nose and Throat Departments Salary £150 p.a.

ROYAL FREE HOSPITAL Gray's Inn Road WC—In patient Obstetric Assistant (female).

ROYAL LONDON OPHTHALMIC HOSPITAL City Road EC—(1) Assistant S. (2) Out patient Officer Salary £100 p.a.

ROYAL MASONIC HOSPITAL Ravenscourt Park, W—Two R.S.O.s (males) Salaries £250 p.a. each.

ROYAL NATIONAL ORTHOPAEDIC HOSPITAL Great Portland Street W—Two H.S.s (males unmarried) for the Brockley Hill Branch, Stanmore Salaries £150 p.a. each.

St JOHN'S HOSPITAL Lewisham, S.E.—H.S. (male) Salary £100 p.a.

SALFORD CITY—A.R.M.O. (male) for Hope Hospital. Salary £200 p.a.

SALISBURY GENERAL INFIRMARY—R.M.O. (male) Salary £250 p.a.

SEAMEN'S HOSPITAL SOCIETY Gordon Street WC—Resident Medical Superintendent (unmarried) for the Hospital for Tropical Diseases Gordon Street WC Salary £400 p.a.

SHEFFIELD CHILDREN'S HOSPITAL—H.S. (male unmarried) Salary £100 p.a.

SHEFFIELD ROYAL HOSPITAL—Whole time Clinical Assistant to the Ophthalmic Department Salary £700 p.a.

SHEFFIELD ROYAL INFIRMARY—(1) C.O. Salary £150 p.a. (2) Ophthalmic H.S. Salary £120 p.a. (3) H.S. (4) Aural H.S. Salaries £50-£100 each.

SHREWSBURY ROYAL SALOP INFIRMARY—R.H.S. (male unmarried) Salary £160 p.a.

SMITHWICK COUNTY BOROUGH—(1) Senior Assistant M.O.H. Clinical Tuberculosis Officer and Deputy Medical Superintendent at St Chad's Hospital Male Salary £750-£937 10s. p.a. (2) Assistant M.O.H. and Assistant School M.O. (male unmarried) Salary £350-£25 £550 p.a.

SOMERSET COUNTY COUNCIL—A.M.O. (male) Salary £500-£25 £700 p.a.

SOUTHAMPTON ROYAL SOUTH HANTS AND SOUTHAMPTON HOSPITAL—(1) C.O. (2) Resident Anaesthetist and H.S. for the Ear, Nose and Throat Department Males unmarried Salaries £150 p.a. each.

SOUTH LONDON HOSPITAL FOR WOMEN Clapham Common SW—Two H.S.s (females) Salaries £100 p.a. each.

STAFFORD STAFFORDSHIRE MENTAL HOSPITAL—R.A.M.O. (male unmarried) Salary £530 £25 £580 p.a.

STOKE-ON-TRENT BURSLEM HAYWOOD AND TUNSTALL WAR MEMORIAL HOSPITAL—R.H.S. Salary £175 p.a.

STOKE-ON-TRENT LONGTON HOSPITAL—H.S.—Salary £160 p.a.

STOURBRIDGE CORBETT HOSPITAL—H.S. Salary £100 p.a.

SURREY COUNTY COUNCIL—Dental S. Salary £500 £20-£600 p.a.

SWANSEA GENERAL AND EYE HOSPITAL—H.S. (male unmarried) Salary £150 p.a.

TUNBRIDGE WELLS KENT AND SUSSEX HOSPITAL—H.S. and C.O. Salary £150 p.a.

VICTORIA HOSPITAL FOR CHILDREN Tilt Street, SW—(1) H.P. (2) H.S. Salaries £100 p.a. each.

WAKEFIELD CLAYTON HOSPITAL—Fourth H.S. (male) Salary £150 p.a.

WEST END HOSPITAL FOR NERVOUS DISEASES W—(1) Hon Medical Psychologist (2) Hon Clinical Assistant (3) Two R.H.P.s (males) Salaries £125 p.a. each.

WEST HAM COUNTY BOROUGH—A.R.M.O. (male) for Whipps Cross Hospital, Leytonstone E Salary £350-£25 £450 p.a.

WEST SUFFOLK COUNTY COUNCIL—County M.O.H. and School M.O. Salary £1,000 p.a.

WOKING AND DISTRICT VICTORIA HOSPITAL—R.M.O. (unmarried) Salary £120 p.a.

WORKSOP VICTORIA HOSPITAL—Junior Resident Salary £130 p.a.

YORK CITY COUNCIL—Two District M.O.s Salaries £130 p.a. each.

CERTIFYING FACTORY SURGEON—The appointment at Shelf (Yorkshire West Riding) is vacant. Applications to the Chief Inspector of Factories Home Office Whitehall SW1 by July 6.

To ensure notice in this column advertisements must be received not later than the first post on Tuesday mornings.

Notifications of offices vacant in universities medical colleges and of vacant resident and other appointments at hospitals will be found at pages 43 44 46 47 48 49 50 51 55 and 56 of our advertisement columns and advertisements or to partnerships assistantships and locumtenencies at pages 52 and 53.

APPOINTMENTS

COYNE William Joseph M.D., M.R.C.P.I. D.P.M., Resident Medical Superintendent Counties Cavan and Monaghan District Mental Hospital Monaghan.

GRUNDY Fred M.D., D.P.H. Medical Officer of Health for Luton.

PORTER, Eleanor G. M.R.C.S. L.R.C.P. D.P.H., Assistant Medical Officer Public Health and School Medical Department Middlesex County Council.

BIRTHS, MARRIAGES, AND DEATHS

The charge for inserting announcements of Births Marriages and Deaths is 9s which sum should be forwarded with the notice not later than the first post on Tuesday morning in order to ensure insertion in the current issue.

DEATHS

CARSWELL—Dr Robert Carswell M.A. M.B. Ch.B., of 61 West Side Wandsworth Common on June 16 1937.

MACKINNOY—On June 19 1937 at St Thomas's Hospital after two days illness Murdoch Mackinnon M.D. D.P.H. beloved husband of Lily Mackinnon of Poplar Lodge East Twickenham, and formerly of Nairobi Kenya Colony Funeral Twickenham Cemetery Wednesday 3 p.m.

Conduct Disorder in Mental Deficiency

Cases of conduct disorder in mental deficiency were not nearly so common as the laity supposed. Cyril Burt had found that of juvenile delinquents whom he had tested with the Binet-Simon tests only 8 per cent were mentally defective. In a large institution for mental defectives the lecturer had found less than 4 per cent. of 1 000 consecutive admissions noted as morally defective. Many of the low-grade cases screamed and kicked when interfered with in any way and were consequently difficult to examine, but this seemed to be a perseverated fear reaction. A stethoscope or tendon hammer was interpreted in their "one-track" minds as an implement with which they were going to be hurt. The really low-grade cases were quite incapable of planning any coherent asocial act, and in the higher-grade cases the same lack of planning ability was noticeable, though coherent behaviour was more possible so that while the defective did not take the initiative in delinquency he might give trouble as a result of persuasion or suggestion by others.

In any case of asocial conduct in the defective it seemed that integration and inhibition were imperfect, and the response to any relevant stimulus too direct and uncontrolled. This might mean a sudden reaction as when a defective was thwarted in his desire and bit out at all and sundry, in which case he might commit an aggravated assault, but this was quite easy to understand and was simply a direct uncontrolled and immediate instinctive response. Dr Gordon cited two cases of his own in which there was not so much an impulsive sudden response to a stimulus as a stupidity of action which failed to weigh consequences.

A deformed dwarf of low mentality earned a pittance by taking in a little laundry. Her one passion in life was affection for her sister's baby. One day she was given the baby to mind, and put it into an empty clothes basket as a convenient cradle. The infant began to cry and thinking he was cold she decided to cover him with some of the clothes which she had been washing. This idea seemed to persevere in her mind as she continued to pile on clothes until the infant was suffocated. There was no doubt that she would not deliberately have hurt a hair of its head. She was tried for murder but on the testimony of Professor Berry and himself pronounced guilty but insane.

Generally speaking, the conduct disorder of the mental defective might be taken as being due to the too direct response of primitive behaviour patterns not far removed from instincts consequent on the poorly developed power of inhibition. This prevented the individual from exerting a normal selection of a socially desirable response to a relevant stimulus or of inhibiting an easy response even to an allied but not strictly relevant stimulus. The deficiency of inhibition depended on a failure of development or an early destruction of cortical neurons resulting not only in a paucity of their numbers but also, what was more important in an irregularity of their arrangement and the formation of a cortical area lacking the differentiation appropriate to the adult brain.

A Transition Group

The transition from the case of conduct disorder which might justly be attributed to organic changes in the brain to the case of purely psychical origin might be illustrated by what the lecturer described as the biochemical group. He mentioned the case of a girl who had been found guilty of persistent stealing but only of sweets or of money to buy sweets. She was found to be suffering from definite hypoglycaemia and on being put on regular supplies of glucose both the physical and the moral trouble cleared up.

It was well established that centres in the diencephalon controlled the carbohydrate metabolism of the body and especially the level of the blood sugar, and low blood

sugar created a tension or disturbance in the diencephalic centres which was in turn transmitted to the effector areas in the frontal lobe. It was not of course true that every person with hypoglycaemia stole sweets but who should say what conditioning might take place in the upbringing of children? A pattern of behaviour was here being established for whose activation the chief stimulus was apparently the hypoglycaemia.

From biochemical needs to biological needs was no far cry. Again to take the dream as an illustration, explorers had related how when deprived of food they were apt to dream of succulent beef-steaks and well-browned welsh rarebits. In the sexual dream the imagery no doubt owed just as much to the messages transmitted to the cortex from an overtense vesicula seminalis as the increased tension of the vesicula and consequent reflex emission owed to the sexual image. The same mechanism emerged in relation to fear, anger, and other instinctive reactions.

Bodily tensions were thus seen to be determining the activation of cortical patterns which were largely ideational and affective in the dream, but these might easily pass over into conative patterns, as might happen in hysterical somnambulism, fugue, and double personalities. In these states as a result of dissociation inhibitions were lifted and centres of excitability were allowed to radiate more freely than when the personality was fully integrated. Presumably Mr Hyde is only Dr Jekyll let loose.

Psychological Types of Conduct Disorder

With regard to psychological types of conduct disorder the lecturer maintained that the great majority of those who committed such asocial acts were not obviously psychotic, or even psychoneurotic and if the attempt were made to classify them into the clinical groupings such as hysteria and anxiety and obsessional states the issue would not be greatly clarified. The key to the situation was usually to be found in some quite obvious condition (as C. H. Town had stated) 'in that complex unity built up by the individual in his interrelations with the home, school, street, church, playground, club and all other institutions and individuals making up his world'.

It was obviously desirable, therefore that in young children stimuli which were likely to evoke undesirable responses should be avoided. As the child grew older the impulses—or instincts, if that word was preferred—became adjusted to each other and to the demands of the environment until a system of ideals and internal inhibitions to the outside world had been built up and began to serve as a means of self-regulation of conduct. What exactly determined the inhibition or lack of inhibition in a given pattern was not exactly known.

That it depends on the biochemical changes involving release of acetylcholine at the synapses may be taken as reasonably certain and we are beginning to find that certain substances have an effect on this process but we are as yet in ignorance of the influences which determine wholesale but at the same time coherent inhibitions or releases. As has already been said the irradiation of excitation or inhibition may be due to inherent factors or acquired influences whether psychogenic or due to organic causes but the same process would seem to be at work in these psychogenic cases from the neurological point of view as in all the other types of conduct disorder. Whatever be the origin of the disturbance we must confess to a great deal of ignorance of the details of the underlying neuronic process. In this respect we must admit that so far histopathological methods are inadequate to answer this question.

In thinking of conduct disorder the brain must be regarded as acting as a whole. Localized lesions could only be "disorders of mental tools" though there was no reason why these mental tools should not continue to be studied for thereby it was possible to understand how the brain worked as an organ and how mental function

described by psychology depended on neuronic function described by physiology. Dr Gordon discussed the different kinds of intercommunication between the various parts of the entire system of thalamo cortical functional areas, and spoke of the thalamus as the principal switchboard of incoming sensory messages. The thalamus might well be assigned a functional role congruous with their central anatomical positions in the central nervous system. The thesis he had presented in his lectures seemed to require that they be functionally regarded as organs contributing largely to what Sherrington had termed the integrative action of the nervous system and this conception seemed useful in assisting the understanding of the neurological basis of conduct disorder with its undoubted affective drive thus linking up the findings of modern psychology with those of modern neurology.

In conclusion, he said that if in these lectures he had disclosed yawning gulfs in exact knowledge and had proved nothing he hoped he had stimulated interest and had encouraged the expectation that one day the two great subjects of neurology and psychiatry might be welded into one harmonious whole. This indeed, with the increased knowledge of these two subjects, was the presumed purpose of the Morison Lectures.

INTERNATIONAL TECHNICAL CONFERENCE ON AERIAL RELIEF

The following report has been received from Colonel E. M. Cowell DSO, of the Surrey Branch of the British Red Cross Society.

The League of International Red Cross Societies, in conjunction with the Hungarian Red Cross have recently held their first International Conference at Budapest. Twenty-five nations including Great Britain, and fifty organizations took part. Two British Monospar machines, three French Caudron biplanes and an Italian three-engined converted bomber (Caproni) proceeded to the rendezvous by air. The journey of 1,225 miles from the Air Port of Croydon was most enjoyable and took about ten hours of actual flying.

The objects of the conference were an exchange of ideas reports on practical experience and demonstrations of actual air medical transport work. Papers on various aspects of air ambulance work were read by French, Dutch, Polish, and British representatives. Two papers by a French and an Italian delegate respectively on the medical importance of the parachute were of great interest. Colonel Ferroni of the Italian Medical Service showed many lantern slides of air work in Abyssinia with especial reference to their method of dropping food, clothing and medical supplies from the air by parachute. The loads dropped averaged 120 kilos in weight.

One day was devoted to demonstrations on the aerodrome at Budapest. The first competition consisted in bringing in by air ambulance patients waiting at an aerodrome ninety miles away. In this event the British Monospar was only four minutes slower than the larger Italian machine. Great attention was paid to dropping supplies by parachute and the enthusiasm of the onlookers was aroused when four Hungarian Red Cross nurses made a graceful parachute descent from 6,000 feet. Previously two French doctors had demonstrated the safety of this method of landing.

The conference teaches the medical profession many useful lessons. In France there are some 200 doctors who have qualified as pilots and are capable of flying their own ambulance machines. Certainly all young doctors in this country should acquire first hand knowledge of air transport even if they do not go on to become pilots. The safety and value of air medical transport is now realized by all. It remains for the medical profession in this country to accept this and translate their air knowledge into practice whenever occasion arises. The profession is urged not only to become air minded but air worthy also.

LONDON AND COUNTIES MEDICAL PROTECTION SOCIETY

The annual meeting of the London and Counties Medical Protection Society was held, under the presidency of Sir CUTHBERT WALLACE on June 16. A tribute of respect was paid to the memory of the late Dr R. L. Guthrie, for several years treasurer.

The Year's Work

In moving the annual report, Sir Cuthbert Wallace said that 1,169 new members had been elected during the year and the membership now stood at 15,135. One tenth of the membership made application for advice and assistance during the year, and nearly 800 cases were dealt with by the solicitors. As president of the Society and studying the cases which continually came before the council the complexity of the modern operation had been brought home to him from a new angle. In the old days the surgeon, without an anaesthetic or with very little anaesthetic would perform an amputation in ninety seconds, but nowadays the operation might be a very long business, and moreover it was no longer the responsibility of one man but of a team. The responsibility of the anaesthetist and of the nurses would have to be defined at some time or other. The surgeon could no longer go on bearing all the risks entailed.

In dealing with the work of the year Sir Cuthbert Wallace mentioned the alteration of its articles recently made by the Society in order to meet the situation which might be created by the Law Reform (Miscellaneous Provisions) Act 1934 whereby it was possible for actions to be taken against the estate of a deceased doctor in regard to some act or fault during his lifetime. The wisdom of this decision on the part of the Society was shown in a recent case (that of Connolly v. Rubra reported in the *British Medical Journal* of December 5, 1936 p. 1174) in which for the first time the estate of a deceased doctor was sued £5,000 damages being awarded and the decision being sustained on appeal. The Society had been able to assist the widow and he thought the action taken whereby the privileges of membership were granted to the personal representative of any deceased member was an excellent instance of intelligent anticipation. Moreover the benefits of membership had been further extended to provide life membership for those members who had retired from practice.

Financial Position

Mr W. M. MOLLISON the new treasurer said that for the first time in recent years the accounts of the Society showed a deficit amounting to £246. This was due largely to the heavy expenses in the case just mentioned and to other cases. The total cost per member was £1 5s 7d., which was considerably more than the subscription received the difference being made up by interest on investments and accumulated balances. It was very important to get more members into the Society and even more important that members should as far as possible exercise circumspection in dealing with patients in matters which might have a legal bearing.

Sir Cuthbert Wallace was unanimously re-elected to the presidency the nineteen vice-presidents were also re-elected as were the retiring members of Council with the addition of Dr Marguerite Kettle and votes of thanks were accorded to the staff and to the legal advisers (Messrs. Le Brasseur and Oakley). Dr C. O. Hawthorne, in speaking to a vote of thanks to the president suggested that greater efforts should be made to bring to the attention of young medical graduates the need for joining a defence organization.

In their report to the Society the solicitors drew attention to the need for keeping professional records. The absence of these had been an embarrassing feature of a case which the Society had fought unsuccessfully during the past year. Members who were insurance practitioners they said would avoid much anxious labour and trouble at a later date if they made systematic entries on their record cards particularly of visits paid to patients. All pertinent correspondence should also be kept.

Reports of Societies

PROBLEMS OF BLOOD TRANSFUSION

The summer meeting of the Association of Clinical Pathologists was held on June 12 in the pathological department of the Royal East Sussex Hospital, Hastings. Dr P. LAZARUS BARLOW, pathologist to the hospital, was in the chair, and the meeting considered various aspects of the problems of blood transfusion.

Organization and Administration

Dr H. F. BREWER (London), medical officer to the London blood transfusion service, spoke on the organization and medical administration of a voluntary blood transfusion service. He made a plea for the co-ordination of all such services in the country in a single scheme. The routine running of a transfusion service was best carried out by a body independent of the hospitals making use of the donors. Medical administration of a service was preferably centralized in the hands of a clinical pathologist. Dr Brewer recommended a full re-examination of donors after every ten, and multiples of ten, donations. He considered the safe minimum time interval between bleedings to be three months for men and four months for women, but there was no need to limit the number of donations given. The needle method of extraction of blood was alone permissible. Certain desiderata were emphasized—the withdrawal of blood from a donor only in the supine position, the avoidance of direct arm-to-arm technique, the use of a local anaesthetic at the site of needle puncture, the exclusion of iodine in the dressing, and the elimination of over-bleeding. He paid a tribute to Mr P. L. OLIVER, the founder and honorary secretary of the London service, to whose large experience he was indebted for several points mentioned in his communication.

The President, Dr S. C. DYKE (Wolverhampton), described the blood transfusion service organized for the Royal Hospital, Wolverhampton by the Rotary and Round Table Clubs of that town. Not only blood donors but also the means of getting them to and from the hospital as required at any hour of the day or night were provided. Dr Dyke showed specimens of the various forms used in the enrolment and registration of volunteers; the system worked with such ease and efficiency that the record time for getting a donor had been two minutes while even at night the time had never exceeded two hours. With a view to ensuring that donors were subjected to no unnecessary pain or inconvenience through unskilful withdrawal of blood, the hospital had established the post of transfusion officer; this was held by the resident assistant pathologist. It was the special duty of this officer to make withdrawals of blood from service donors, to give or assist in giving transfusions, and to maintain all necessary apparatus and solutions in readiness for immediate use. The combined donor and transport service had proved of great benefit to the work of the hospital.

Storing Blood

Dr NORAH SCHUSTER (London) described some experimental work on the keeping properties of blood. The red cells in ordinary citrated blood remained intact for about twenty-one days after which haemolysis began. They could be kept longer by adding glucose to the blood and in certain physiological fluids they had remained intact for 190 days. Red cells were still physiologically active in the circulation of a recipient animal after having been kept for fourteen days; they could also be kept for four weeks and retain their power of absorbing oxygen. By the Russian method of storing blood taken from a

cadaver a few hours after sudden death, larger quantities could be collected from the donor, and there was no need for the addition of citrate on account of fibrinolysis. She also described methods used in France, Spain, and South America for the storage of blood from living donors. The medical service of the Government forces in Spain in the course of the present rebellion were using blood stored in ampoules under a positive pressure of two atmospheres for emergency work. The blood was usually of Group A or O, and was administered straight into the vein from the ampoule, as a rule by medically unqualified orderlies or nurses. The period for which it was kept was three to four weeks. Experience showed that there was no likelihood of damage from infection or the development of toxins in blood stored for one month.

In a brief discussion which followed Dr R. V. FACEY, Dr A. F. S. SLADDEN, Dr J. OLIVER and Dr BREWER took part.

Abnormal Reactions after Transfusion

After Dr J. A. BOYCOTT (London) had described three cases of anomalous blood grouping reactions, and stressed the danger of placing too much reliance on grouping alone and the necessity of careful matching of bloods for transfusion purposes, Dr R. J. V. PULVERTAFT (London) discussed certain abnormal reactions after transfusion. He referred first to some of the effects of infusion of simple saline. In a number of cases coming to necropsy after saline infusions he had found oedema of the lungs and of other viscera, particularly the heart. He suggested that physiological solutions such as that of Hartmann were preferable to normal saline. Certain reactions after the transfusion of blood were in his opinion allergic; he recalled one case in which a transfusion was followed by severe urticaria. Four transfusions with incompatible blood were described; in no case was the amount transfused over 300 c.c., and all recovered. Incompatible blood had been administered owing to wrong grouping, this being due to loss of potency of the grouping serum through the addition of phenol as a preservative. Dr Pulvertaft stated that he had injected doses of from 5 to 20 c.c. of incompatible blood at weekly intervals into patients over long periods, no untoward symptoms had occurred, and he considered sensitization to blood previously given from the same donor an unlikely cause of reactions. He had seen haemoglobinuria follow transfusion in four cases of haemolytic anaemia. The infused red cells being normal theoretically ought not to be susceptible of lysis, but perhaps in these diseases the organism attained a certain red cell level, and on infusion it was the subject's own red cells, and not those of the donor, that were destroyed. After splenectomy lysis following infusion of blood did not occur.

Dr N. H. FAIRLEY pointed out that American figures showed that infusion into an adult of up to 350 c.c. of incompatible blood had never caused death while infusion of 540 c.c. or over had invariably proved fatal. This suggested a critical level for the disposal of the products of haemolysis.

Dr NORAH SCHUSTER said that in any form of shock without severe blood loss transfusion was not required; she thought far too many transfusions were being performed. Many members agreed with this view. Dr JANET VAUGHAN believed that transfusions were given far too casually; many of the untoward incidents which followed were due to chilling of the infused blood; this was liable to give rise *in vivo* to haemolysis. The President, Dr S. C. DYKE, said that reactions after transfusion, apart from those dependent on incompatibility, were due to inattention to essential details. The most important of these were the temperature of the blood, the use in making up solutions of freshly glass-distilled water, and strict cleanliness of all apparatus. He employed a small glass reservoir from which the blood was run in by gravity. The rubber tubing was kept in short lengths, which were taken apart for cleaning and united by metal joints for use.

Methods of Transfusion

Drs H L MARRIOTT and A KERWICK (London) described the transfusion of blood in large quantities by the continuous drip method. The purpose of the method was to bring the red cells of the recipient's blood up to a suitable level as quickly as possible. When large quantities were infused slowly the red cells remained in the circulation but the fluid elements were excreted. The principal indication for continuous transfusion was persistent bleeding.

Dr LAZARUS BARLOW said that the direct method of blood transfusion was that of choice. The blood transfused was less interfered with and it did not entail the exposing of the veins of either patient or donor. In nearly four hundred transfusions, the great majority of which were carried out by the direct method, no donor's vein had been exposed. A Louis Joubé syringe of 5 ccm capacity was used. No 17 gauge Record needles being connected to the syringe by two pieces of thin pressure tubing each about six inches long. The essential point was to keep the piston constantly on the move once the transfusion had started in order to prevent clotting. It might be argued that this entailed giving the blood too fast, but no ill effects from this cause had been observed. The only contraindications were when a constant drip transfusion was required and when a comparatively large transfusion was needed in the case of a patient whose veins were too small to admit a No 17 gauge needle. Dr R OFFICER described a method for post-operative blood and saline transfusion. Patients recovering from long and severe operations required large amounts of water and salt in such cases the urine was free from or low in chlorides. Both blood and saline were administered by the "drip" method, and were kept in separate containers, he had devised a special apparatus by which a change-over from blood to saline could be effected without undue admixture of the saline and citrated blood. This was important, as the addition to citrated blood of saline often led to clotting. As a routine 500 to 700 ccm of blood was given immediately on the return of the patient from the theatre, this was followed by saline at the rate of three and a half to four pints in each twenty-four hours for forty-eight hours. In a series of twenty-seven cases of combined excision of the rectum in which this technique had been employed there had been only one death.

Transfusion in Blood Diseases

Dr F A KNOTT (London) represented in his absence by Dr CUTHBERT DUKES reported on four cases of aplastic anaemia treated by repeated transfusions. It was pointed out that the blood picture could by this means be restored to normal but there was no means at present of judging whether or not the haemopoietic system would be capable of maintaining normality. By a careful study of his cases Dr Knott had arrived at the conclusion that a continued reticulocytosis was a bad prognostic sign, indicating a state of strain on the part of the haemopoietic system. In three cases out of the four such a reticulocytosis had persisted and all had ended fatally, in the fourth case after repeated transfusions the reticulocytosis had disappeared and the patient was now doing well.

Dr N H FAIRLEY (London) reported observations on the formation of pseudo methaemoglobin in intravenous haemolysis. He pointed out that disintegration within reticulo-endothelial cells was the normal physiological fate of the erythrocyte. Lysis in the blood stream was a pathological event. The clinical syndrome was characterized by sudden rigor, fever, pain in the loin anaemia, haemolytic jaundice oliguria and perhaps anuria. The pathological lesions consisted of haemosiderosis blockage of the renal tubules toxic changes in their lining epithelium and possibly degeneration of hepatic cells. Extracorporeal haemoglobin was treated as a foreign substance some 10 per cent was excreted through the glomerulus and appeared in the urine if a pH of less

than 6.4 was reached in the tubules, methaemoglobin and possibly acid haematin was formed (Dodds). Sifting up effects followed under these circumstances, and led to oliguria, anuria nitrogenous retention with a high blood urea and renal acidosis with a low plasma bicarbonate level low serum calcium, and a high blood phosphorus. The remaining 90 per cent appeared to be disposed of by the reticulo-endothelial cell system and liver the oxy-haemoglobin producing haematin, which gave rise to haemosiderin and haemobilirubin.

Recent work on blackwater fever by Fairley and Bromfield had shown the presence of another pigment in the plasma allied to methaemoglobin, but having its spectroscopic band somewhat nearer the blue end of the spectrum (6240 Å). This band, unlike methaemoglobin, was not dispersed with Stokes's reagent, ammonium sulphide (10 per cent) ammonia, or hydrogen peroxide (10 vols). The new pigment was formed both *in vivo* and *in vitro* by the action of plasma on haemoglobin, and was probably an intermediate compound in the production of haematin. It was not excreted by the kidneys, and from this viewpoint its formation was a conservative process protective to the organism. It was constantly found in severe cases of blackwater fever, and was probably ultimately formed in all instances of intravascular haemolysis.

RECENT ADVANCES IN OBSTETRICS

At a meeting of the London Association of the Medical Women's Federation on May 25, with Miss E C LEWIS the president, in the chair, Miss KEREN PARKES read a paper on recent advances in obstetrics.

Miss Parkes said that for the purpose of discussion clinical obstetrics could be divided into the ante-natal, intra-natal, and post-natal periods. Ante-natal care could not be limited to the nine months of pregnancy, since the woman's adjustment to this would depend on the state of her health and nutrition for years past. For early diagnosis the Aschheim-Zondek and the Friedman tests had a high degree of accuracy and had other uses, notably in diagnosing the intra-uterine death of a foetus, the presence of a vesicular mole, and the onset of chorion epithelioma. A state of pregnancy having been diagnosed, the next problem was to maintain it. In cases of repeated abortion extracts of corpus luteum were now given. Since this extract was unfortunately still very expensive an alternative method was to give large doses of a substance stimulating luteal activity which was found in the urine of pregnant women, and marketed as antuitrin S or progynon.

There were three main objects in ante-natal work: the avoidance of difficult labour due to malpresentation and disproportion, the prevention and treatment of toxæmias, and the education of women in mothercraft and the hygiene of pregnancy. By radiological pelvimetry it was now possible to compare the actual diameters of the pelvis and of the foetal head. Unfortunately, estimates based on these elaborate measurements were all static, and failed to allow for the alterations in flexion and the moulding of the head which took place under the influence of the uterine contractions. In breech presentations external version was now undertaken rather earlier than it used to be—from the thirty-second to the thirty-fourth weeks, instead of from the thirty-fourth to the thirty-sixth. Where version failed and the legs were extended it was no longer customary to bring down a leg when pelvic measurements were normal unless there was delay in the second stage. In cases of acute hydramnios in which x-rays revealed a normal foetus, the tension of the liquor caused severe abdominal pain. It had been found possible to tap the amniotic sac through the abdominal and uterine walls if necessary on several occasions, without disturbing the pregnancy.

The toxæmias of pregnancy were now regarded as being primarily metabolic disturbances. The best protection

against, toxæmia was a good mixed diet, including fresh foods, with plenty of iron, calcium, and vitamins but it was still necessary to be constantly watching for early signs of toxæmia. Routine urine tests and blood pressure readings were now the rule, but in the estimation of oedema an interesting advance had been the recognition that much help could be obtained from regularly weighing patients, "occult oedema" being revealed by any excessive gain in weight. It appeared from Dame Louise McIlroy's work that the normal gain was greatest from the twenty-fourth to the twenty-eighth week, being on an average 3 lb, while in toxic cases the maximum gain occurred rather later, from the twenty-eighth to the thirty-second week, and was about 4½ lb. Miss Grace Jones had drawn attention to the state of the retinal arteries as an index of the condition of the arterioles elsewhere in the body, particularly in determining when the changes were such that permanent renal damage was likely to result. Any sign of retinal exudate or hæmorrhage was an indication for the immediate induction of labour.

Intra-natal Period

In the intra-natal period the general trend was to minimize interference of every kind. The passage of the head through the pelvis was a dynamic problem in which the uterine forces were quite as important as the relative sizes of passage and passenger. Induction of labour had now no place in the treatment of primigravidae with suspected disproportion. Doubtful cases of disproportion should all be submitted to a trial labour at term. If after the membranes ruptured there were good pains for some hours, but the head was not satisfactorily low in the pelvis, Caesarean section must be performed. The lower segment operation could safely be undertaken much later in labour than the classical operation. The routine use of anaesthetics was becoming more general, and for the normal delivery self-administration of gas and air was considered best.

One complication of labour which had received more attention lately was the contraction ring which occurred in otherwise perfectly normal cases causing prolonged delay and ultimately obstructing labour. When diagnosed early in the first stage the treatment was lower segment Caesarean section. Later, when infection had occurred and the child was dead, morphine, deep anaesthesia, and constant traction by weights attached to the perforated head were the only methods available to relax the ring. Should the contraction appear in the second stage forceps delivery might be accomplished under deep anaesthesia. In the third stage when fortunately the complication was rare, treatment was by manual removal of the placenta after dilatation of the ring—a very difficult procedure.

Puerperium

Finally Dr Parkes referred to the importance of droplet infection of septic foci in the patient herself and of conditions such as tonsillitis or ear discharges in other members of the family, in the prophylaxis of puerperal sepsis. The hæmolytic streptococci concerned had been differentiated into twenty-two different types varying in virulence, the eleventh being the worst. The use of prontosil album marked a great advance in treatment. A complication which might arise from its administration was sulphæmoglobinæmia which was manifested by cyanosis especially of the lips without any cardiac or respiratory distress. The condition seemed to be harmless provided the prontosil was stopped as soon as the cyanosis was noticed. Epsom salts should not be given to patients on prontosil nor in fact any drastic purgative for even those which did not contain sulphur increased the sulphides in the bowel by their irritating action.

An electrically driven breast pump was another recent innovation. Increasing interest was being shown also in the reconditioning of weakened abdominal and pelvic muscles by massage and exercises. More practical advice was being given to women about the proper spacing of

their pregnancies, and patients with heart or kidney disease were given careful instruction in birth control rather than a vague statement that they must not have any more babies. The available clinics giving advice on contraception were still woefully overworked and overcrowded, and there were large areas without any, but the need for them was being recognized and their numbers were increasing.

Dr Parkes illustrated her address with some films of a type of lower segment Caesarean operation of difficult cases of breast feeding, and of a case of pseudo-pregnancy showing the disappearance of the phantom tumour under anaesthesia.

THE HEART IN DIPHTHERIA

At a meeting of the Fever Hospital Medical Services Group of the Society of Medical Officers of Health in London on May 28 Dr H MASON LEETE, medical superintendent of the Hull City Hospital, read a paper on the heart in diphtheria.

Dr Leete said that during the past six years (in Hull) clinical observations had been made on many severe cases of diphtheria in an attempt to classify the varying degrees of cardiac dysfunction resulting from toxic effects on the myocardium. A clinical distinction was drawn between death from general toxæmia in the first week of disease and 'cardiotoxic' death in the second and third weeks. Characteristic pulse-rate curves were seen in severe and moderately severe cases of myocardial damage. Fairly constant changes in the relative intensities of the heart sounds occurred during the progress of a severe case, with extrasystoles and reduplications. It was possible perhaps to place these phenomena in a scale which showed increasing or decreasing cardiac impairment. The explanation of some of the phenomena called for a careful comparison of clinical and electrocardiographic findings.

General Discussion

Dr M MITMAN said that in the first week diphtheria was evidenced by local lesions and general toxæmia but electrocardiographic changes were rare. In the second week there were clinical and corresponding electrocardiographic manifestations of cardiovascular damage in the more severe cases. Of the electrocardiographic signs the most common were changes in the form and voltage of the QRS complex, in the direction of the T-wave in significant leads, and there was evidence of lesions in the conducting bundle and its branches. He believed that lengthening of the P-R interval was not common and that when damage to the main bundle occurred it produced a complete heart-block, which sometimes occurred with a normal pulse rate. An indication of serious cardiovascular damage could be obtained not only from the quantity of albumin in the urine, but also from the diminution in the amount of urine passed. He believed that the cardiovascular phenomena in the paralytic stage, as well as the paralyses themselves, were of central nervous origin. He had inquired of physiologists if the cardiac irregularities and the tachycardia of this stage could be produced by damage to the central nervous system, and had been assured that they could.

Dr H S BANKS said that of the various factors concerned in the production of the heart lesion in diphtheria not the least important was the dosage and route of injection of the antitoxin. He advocated larger intravenous doses of antitoxin as a means of preventing or modifying the heart lesion of toxic diphtheria. Dr E JAMES thought that gravis strains were not always responsible for a high case mortality. In a series of some 800 cases of diphtheria admitted to hospital from Dagenham, Hornchurch and Romford during the past two and a half years approximately 70 per cent of the strains of *C. diphtheriae* were classified as gravis and 20 per cent as intermediate strains, yet the latter had been nearly twice as lethal as the gravis type.

THE PSYCHOLOGICAL APPROACH

At a meeting of the Medical Society of Individual Psychology on June 10 Dr T A Ross read a paper entitled 'The Psychological Approach'

Dr Ross said there were two aspects presented by such an approach—namely, the understanding by the physician of his patient's illness and the understanding by the patient of the origins and causes of his illness in so far as these were psychogenic. From the standpoint of the physician two views might be contrasted. According to one there was no psychological approach. In the absence of physical signs people who said they were suffering quite clearly were not and in an ideal society would have been handed to the policeman or the priest but for the fact that in the world as it is neither of these functionaries would do their duty in this matter. According to the second view as expressed for example by Groddeck, psychogeny embraced the whole of medicine and was the key to the understanding of every patient. Whether an illness was traumatic or microbic the patient came by his catastrophe because he wished it, the catastrophe being preferable to something which it averted. For Groddeck intention was the key to everything. But this view was unprovable. Anxiety could be found in any case if it were looked for industriously enough, and there were many who wished for an illness but did not get it. Indeed many obviously refused the advantage which their physical illness might confer on them, and went about courageously when they might well be and could be, at rest. Illness, even if not psychogenic in origin, must soon be complicated by events. The average man did not want to be ill; he wanted to do a lot of things which illness prevented: to play or watch football, to play golf, or go to the cinema. Illness brought fear, anxiety, loss of confidence in the doctor, resentment against employers, hope of unearned increment, and other factors inimical to recovery.

The truth was intermediate between the doctrine of physical causation and that of pure psychogenic causation. It seemed obvious that every patient presented both a mental and a physical problem. For this reason, among others, medical psychologists of all people had much need to look more at patients and less at books. Medical psychology had suffered of late from having one clinical observer of outstanding genius, with no one quite competent to criticize him effectually who was surrounded by a cohort of praetorians ready to slay any outside critic.

Dr Ross said that when he began to study the effect of mind on bodily symptoms he was living and working in the Isle of Wight, in isolation from others interested in the subject. There were disadvantages in this, there were also considerable advantages. There were advantages in having a director to supervise one's earlier cases, but the pupil tended to become subservient to the teacher, to lose his critical faculties, to depend less on the picture provided by the patient and more and more on the master's ideas. With the regulation that every would-be therapist must himself be analysed before he started treating others there was an end to originality. No one ever quite recovered from an analysis. The patient might lose his illness, but every successful analysis whether of patient or of pupil must result in the more or less permanent adoption of the analyst's views. One might hope to get a number of people well without making them subjects of transference neurosis which might sometimes be an incurable neurosis meaning that the doctor shared the illness with the patient instead of some member of the latter's family doing so.

There were two possible strategic methods for the psychological approach: one was analysis and the other persuasion. Whenever a history was taken an interpretation was probably made; there was little difference between this and analysis. Whenever a prognosis was given persuasion was used. Persuasion might be divided

into encouragement and discouragement, each had its place. There was one pitfall and one only about encouragement: it might be the last thing the patient sought or desired in which case it might make him worse. The good doctor must believe in his treatment. No one could give encouragement, unless he were a rogue, about something in which he had no faith. The analytic approach was of value in the psychoneuroses and in every kind of chronic illness. The analytic approach did not necessarily mean deep analysis and many psychoneurotics could be got to remain well for years without any knowledge of their infancy or young childhood. Deep analysis had its uses, but every abdominal pain did not call for a laparotomy.

Local News

IRELAND

An Outbreak of Puerperal Fever

The report of the Rotunda Hospital, Dublin, which covers the twelve months to October 31, 1936, states that there has been a considerable advance in the programme of reconstruction under the auspices of the Irish Hospitals Sweepstakes Fund. During the six months following the opening of the new out-patient department an increase of 30 per cent in the number of patients attending is reported. An account is given of a serious outbreak of haemolytic streptococcal sepsis in March and April following a smaller epidemic in the two preceding months. Fourteen patients were affected and there were four deaths, a mortality of 28 per cent. The report points out that extensive building and alterations were taking place in the hospital at that time, and that it was therefore difficult to maintain general cleanliness. The outbreak also coincided with a severe epidemic of streptococcal throats in both the hospital and in the city. The sequence of events is frankly described. On January 3 labour was induced in a primipara Mrs A. A normal puerperium followed until the eighth day, when, the patient complaining of sore throat, a throat swab was taken, from which grew a pure culture of haemolytic streptococci. The two nurses attending this case subsequently attended Mrs B, who also developed a streptococcal throat. Mrs B elected to leave hospital with a temperature against the advice of the staff. Throat swabs were then taken from the two nurses, and both grew haemolytic streptococci, the two nurses were sent home. Meanwhile Mrs C, delivered by forceps on February 1, had been nursed in the bed beside Mrs B by these same nurses before their throat condition was recognized. Mrs C developed a rigor on the fourteenth day; a blood culture was positive for haemolytic streptococci, and she died twelve days later. The next case recorded was in a Mrs D, who had a spontaneous delivery on February 15, followed by a rise of temperature on the second evening. A cervical swab produced haemolytic streptococci. The patient recovered. In this case no contact with infection could be traced. An interval of calm now supervened until Mrs E delivered on March 25 and attended by a nurse subsequently found to have streptococci in her throat, developed a puerperal infection of haemolytic streptococci. Some ten days later several cases appeared in rapid succession. Of these one patient was delivered on April 5, two on April 7, two on April 8, the remaining cases were delivered on April 11, 14, and 21 and May 8. It is noted that in seven of these fourteen cases there was no vaginal interference of any kind. Six of them started in the same puerperal ward and eight were in direct contact with droplet or spray infection from a positive streptococcal throat. The report describes the thorough precautionary

measures taken, and it is stated that following this epidemic all those conducting cases in the labour ward and all nurses washing up puerperal cases in the lying-in wards have been ordered to wear masks. It is further suggested that the question of spray and droplet infection is not sufficiently stressed in the rules of the Central Midwives Board, and that under Rule 9a the infective danger of sore throats and colds should be clearly stated.

SCOTLAND

University of Glasgow

At the graduation ceremony of the University of Glasgow on June 16 Sir Daniel M. Stevenson, Chancellor of the University, presiding, doctorates in law were conferred upon thirteen persons, of whom six were members of the medical profession. Professor Gibb, in presenting these graduands in law, said that Professor Boeke, who is professor of histology and embryology in the University of Utrecht, was the foremost living authority on the histology of the nervous system. Dr. John Marshall Cowan was one of a family which for four generations had been eminent in the practice of medicine in Glasgow; he had won an international reputation in cardiology. Dr. Walter Elliot was a distinguished graduate of Glasgow in science and in medicine who had reached Cabinet rank as Minister of Agriculture in 1932, and was now Secretary of State for Scotland. Professor T. K. Monro had held the regius chair of medicine in the University of Glasgow from 1913 to 1936, and during these years had efficiently served the Glasgow medical school as the author of literary work he had shown himself to be a scholar of distinction. Sir Robert Muir had occupied the chair of pathology in the University of Glasgow for thirty-seven years, and during that time had contributed in abundant measure to the great advances in the science of pathology. Professor Ralph Stockman had held the chair of materia medica and therapeutics in Glasgow for thirty-nine years, justifying an already brilliant reputation by his work both in the wards and in the lecture room.

NEW BOTANY LABORATORY

After the graduation ceremony the new laboratory of the botany department was formally opened. Principal Sir Hector Hetherington, who presided, said that the previous botany building had been one of the earliest science buildings in the University and it required expansion. Sir Daniel Stevenson, the Chancellor of the University, had accordingly agreed to provide the sum necessary. Sir A. C. Seward, eminent professor of botany in the University of Cambridge, in opening the laboratory spoke of the aims of experimental inquiry and said that they were gradually getting nearer to the causes and the unseen mechanism that regulated living processes. They were hopeful of being able some day to demonstrate the chain of events connecting a stimulus in plants with the final reaction and responses that followed. This demanded not only a knowledge of plant structure but a considerable knowledge of chemistry and physics, and he expected that this new laboratory might construct one of the links still needed in this chain.

Problems of Mental Deficiency

At a conference of the Scottish Association of Mental Welfare held in Edinburgh on June 4, Sir William McKechnie, presiding, a paper on Mental Hygiene was read by Dr. Lewis C. Bruce, formerly medical superintendent of Perth District Mental Hospital. He said that according to statistics the mentally defective section of the population was increasing by 1 per cent in every ten years, despite the provision of hospitals, clinics, and child welfare centres. These institutions, however, patched up a large number of C3 people who, when discharged

married and reproduced more C3 people. In other words, civilization was slowly but surely producing race suicide. There had been great civilizations in the past and one might speculate what had destroyed them. Clinics were palliative not preventive, although child welfare clinics might in time prove preventive by educating future mothers. The question of sterilization was being constantly discussed, but this would not affect the class from which the mental defective was largely recruited, for not many people were willing to admit that they were of C3 calibre. The public must be educated to a knowledge that like produced like. Medicine had made great strides in the prevention of infectious diseases, and the deaths from tuberculosis had been reduced by 25 per cent in the last twenty-five years. Why should the increase of mental deficiency not also be reduced by research and the constant teaching of the laws of health? Dr. W. D. Chambers said that it was essential that the physical defects and disorders concealed behind more striking psychological disorders should not be overlooked, for at least 25 per cent of so-called mental deficiency was environmental and therefore open to attack. Professor D. K. Henderson, Edinburgh, said that there was a tendency to relegate the psychiatrist to the background and to call for him only in extreme cases, whereas he should be consulted at the beginning of mental disorders. Dr. T. R. C. Spence, medical superintendent of the Royal Scottish Institution, Larbert, in a paper on "Problems of Mental Deficiency," said that Scotland had eight defectives per 1,000 of the population or in the total population in round figures some 38,500. Taking into account the age distribution of these it might be said that for adults institutional accommodation was needed for 13,000 while 9,500 could remain at home under supervision. The education authorities would look after 11,500 of the children, 2,000 might remain at home, and 2,300 ought to have institutional care. At the present time only 4,410 mental defectives in Scotland were in residence in institutions or under conditions of official guardianship. There was great disparity in the proportion of mental defectives in different parts of the country, and this showed either neglect in ascertainment of their condition or a very serious shortage of institutional accommodation. The latter was certainly true for there were only 2,627 cases under care in Scotland outside Glasgow. Sterilization could not be regarded as a substitution for the segregation, training, and guardianship of the feeble-minded. Segregation was now regarded as the most humane and the most suitable method of controlling mental defect. Many low-grade mental defectives when retained in their homes were an intolerable burden, and though the apparent cost of caring for all these might be heavy, it was a true economy in the long run compared with the price which had to be paid for neglect.

Research in Animal Diseases

An extensive programme of investigation into the cause and prevention of disease in farm animals confronts the Animal Diseases Research Association, whose Institute situated at Moredun near Edinburgh is under the direction of Dr. J. Russell Greig, M.R.C.V.S. It has for some time become apparent that the existing laboratories and animal accommodation at Moredun were insufficient for the Research Association's rapidly extending work, and Treasury sanction has recently been given to the recommendation of the Agricultural Research Council and the Department of Agriculture for Scotland that a grant not exceeding £9,800 should be made available (after taking into account any receipts from other sources) from the Development Fund to enable extensions to be undertaken. In view of the economic importance of grass sickness it became clear that further extension and intensification of the research into the cause and prevention of this disease were necessary. Besides the capital sum already mentioned the Treasury has sanctioned an appropriation from the Development Fund to the Department of Agriculture for Scotland of such sum not exceeding

£3,200 as, after taking into account any funds provided from other sources, might be required by Moredun Institute to meet the expenditure for extended work on this disease during the current financial year. It will now be possible to test on a large scale in the field the value of vaccination of horses against infection with grass sickness, and additional temporary veterinary appointments have been made. While the cause of this fatal disease, which is reported to have killed some 1,200 to 1,500 horses last summer and is by no means confined to Scotland is suspected to be due to poisoning developed in the intestine by certain bacteria taken in on grass or in some other way during feeding this theory, though promising is not yet proved. The vaccination trial which is being made after careful preliminary experiments, is intended as a further test of the theory.

Child Welfare in Fife

In an address at Dunfermline on June 8 Dr R. A. Krause speaking of child welfare services in the county, said that an orthoptic clinic had been set up by the Carnegie Dunfermline Trustees at the Dunfermline and West Fife Hospital, and this had been of great service to children suffering from squint. At the ear, nose, and throat clinic the introduction of audiometers had resulted in renewed interest in defective hearing, and important researches were proceeding into the extent to which amplification of sound could be utilized in the education of partially deaf children. It had been shown that 87 per cent of such children could be expected to derive some measure of benefit from the use of the magnification of sounds in class. An orthopaedic clinic had been in operation for some years, and a register of children in the county with crippling conditions had shown the extent to which such aid was necessary. The increasing number of petty delinquents among children left no doubt as to the urgency for setting up child guidance clinics in different centres of the county.

ENGLAND AND WALES

Domiciliary Midwifery Service for London

At the meeting of the London County Council on June 22 the Hospitals and Medical Services Committee put forward its detailed proposals for submission to the Minister of Health for the setting up of a service of midwives for domiciliary midwifery and for domiciliary maternity nursing adequate for the needs of London, in pursuance of the provisions of the new Midwives Act. These proposals were provisionally set out in an article in the *Journal* of May 8 (p. 989). They provide that the service shall be maintained by salaried midwives employed by the Council either directly or by arrangement with voluntary organizations and that the county shall be divided into five areas for the purposes of the scheme. It is proposed that forty-two midwives shall be employed directly by the Council and that in making the appointments preference shall be given to thoroughly competent independent midwives practising in London. The committee has been in consultation with the Metropolitan Boroughs Standing Joint Committee on the subject and has argued that it is impossible to draft proposals on a borough basis. The need for large areas arises from the special conditions of London. There is a multitude of public and voluntary agencies many of them overlapping and some in active competition with each other which are concerned with the provision in London of institutional and domiciliary midwifery services and a completely co-ordinated maternity scheme can only be attained by the voluntary co-operation of all these agencies. The Council has every expectation of securing

the co-operation of practically all the voluntary organizations connected with domiciliary midwifery.

It is estimated that there are some 2,000 cases a year in which maternity nursing (non resident) is done by midwives in private practice or employed by district nursing associations. After an order has been made by the Minister applying to London Section 6 of the Act, which prohibits unqualified persons from nursing women in child birth for reward, it may be anticipated that there will be an increase in the demand for the maternity nursing service provided by the Council, although it is impossible to forecast its extent. An increase of 1,000 cases has been taken as a probable figure, making a total of 3,000 cases.

The committee is also recommending that when the new scheme is brought into operation no charge should be made in respect of the fees paid to medical practitioners called in by midwives in emergency. Recovery of these fees is at present made on a prescribed scale graduated according to income, but when the weekly income is £2 or under no assessment has been made. It has been found that in the majority of cases the assessment in respect of the services of the midwife will be less than the actual fee and in these cases recovery of medical practitioners fees, in addition to recovery of the fee in respect of the service of the midwife, will not be possible. The amount hitherto recovered in respect of medical practitioners fees is approximately £800 a year, and the cost of collection £420. Particulars as to the number of midwives to be employed, their remuneration, and the fees to be charged were given in the earlier article of May 8.

The Work of a Port Medical Officer

The report for 1936 of the medical officer of health to the Port Sanitary Authority of Liverpool is full of interest. Two cases of anthrax were treated at Fazakerley Hospital during the year. In one case which was very severe, the patient was a fruit selector, whose work necessitated attendance at the unloading of cargo from in-coming ships, the other, which was mild, was that of a woman from Runcorn whose husband worked at a tannery, although she herself was at no time in direct contact with infected material. Imported dangerous wools pass through a disinfecting process, and samples before and after treatment are examined by the city bacteriologist. The necessity for this disinfection is shown by the statement that out of 358 samples examined all those thus treated were found to be free from infection, while 104 of the untreated samples showed positive evidence of anthrax infection. That there were no cases of human plague may be attributed to the thoroughness and efficiency of the precautions taken. The section of the report devoted to 'The Hygiene of Crews Spaces' shows that a lamentable state of affairs still persists in many British vessels. A number of photographs illustrate crew accommodation. The first three show the scandalous conditions prevailing in a vessel built as recently as 1924. The men eat and sleep in the same cramped quarters food is strewn about the bunks the only means of washing is one solitary bucket. The report states that 'the worst type of crew accommodation is seen in this vessel, but such conditions are by no means uncommon. A second series of photographs give typical pictures of the average conditions in a modern British cargo steamer, the vessel in question was launched in 1935. Here there is indeed a separate mess room, but the sanitary arrangements are without privacy, only cold salt water is available for washing and hot fresh water has to be carried in buckets from the galley. The remaining photographs present a striking contrast to the foregoing examples. They show the accommodation that can be and should be provided ample lockers, separate chairs at tables instead of forms, and hot and cold fresh water and shower baths. The report states that 'it was particularly pleasing to notice the interest which all

members of the crew took in these quarters and there is no doubt that this environment added considerably to efficiency and well being." Still further improvements are shown in the case of a foreign owned vessel, which provides reading lights over the bunks, armchairs, separate tables, a wireless set, and constant hot water electrically heated and thermostatically controlled. It is suggested that the provision of such amenities involves only a negligible increase in the total cost of a vessel, and that the improved morale and efficiency of the crews must more than compensate for any additional expense. During the year 5,466 ships were inspected and in 605 of these defects or nuisances were detected. It is unsatisfactory to note that British ships compared most unfavourably with foreign ones in this respect. Whereas only one foreign ship in twenty-six showed sanitary defects, the British ratio was one in eight. Verminous quarters and dirty forecables were frequent in British ships. Greek and Spanish vessels provided an excessive proportion of the defects in foreign ships, in the sixty seven Finnish and fifty-four German ships inspected no defects were found.

Mobile X-Ray Service

One of the most notable advances in recent years in the services rendered by the Home Service Ambulance Committee of the Joint Council of the Order of St John of Jerusalem and the British Red Cross Society has been the establishment of a mobile x-ray unit, and at the risk of repetition a few words may be said here about the advantages of that unit and the very high standard of the work that is carried out. No expense has been spared in equipment and the committee has had the advice and help of leading radiologists, and has also secured the services of a highly skilled radiographer. The power generated in the car enables such speed of work to be attained that chest, gastro intestinal, gall-bladder, and kidney examinations, for example can be carried out with precision. The range of service afforded by this mobile unit approaches that of a first class stationary outfit to be found in large general hospitals. It operates chiefly in London and the Home Counties but it is to be hoped that it will not be long before similar units are available for other parts of the country. The possibility of carrying out effectively the most difficult radiological examination of patients in their own homes marks a definite advance in the range of resources at the disposal of doctors and surgeons. At the end of March 1937 the total number of ambulance stations in the country equipped by the committee was 142, in addition 227 stations were affiliated to the service making 369 in all. During the quarter ended March 31 the number of patients carried in the ambulances was 40,097 making a total since the inception of the service of 1,764,176.

Central Midwives Board

At the June meeting of the Central Midwives Board for England and Wales approval as a supernumerary examiner was granted to Mr Robert Leslie Dodds MCh. F.R.C.S. A letter from the medical officer of health for Gloucester regarding the calling in of medical aid by a midwife when she is recalled to a case after having ceased attendance thereon was considered and it was resolved to reply that

Under the provisions of Rule E. 17 (c) the minimum period of attendance by a midwife in a normal case is fourteen days. If any illness or abnormality of patient or child occurs during this period the midwife must to the utmost extend for medical aid in accordance with the provisions of Rules E. 12 to 15. In an abnormal case the period of attendance may be longer than fourteen days—the actual period cannot be specified because it will vary with the special circumstances of each case. If a midwife after completing attendance on a case in accordance with Rule E. 17 (c) resumes attendance on the case then the Rules E. 12 to 15 apply. The rules in Section F apply (as far as applicable) in the event of the mother or child

suffering from illness connected with the confinement. Among the rules which apply in such case are those (Rules E. 12 to 15) which relate to the summoning of medical aid. The Board desires to emphasize the fact that the rules relating to the summoning of medical aid are concerned solely with the calling in of a doctor in an emergency by a midwife to a case which she is attending in the capacity of a midwife. If a patient who has been attended during her confinement and the lying in period by a midwife acting as such sends, after the midwife has ceased attendance, for a doctor owing to the illness either of herself or of her child and the doctor instructs the mother to send for her midwife such midwife if she agrees to resume attendance will be acting as a nurse and not as a midwife, and consequently will not be entitled to issue a medical aid form under the provisions of Section 14 of the Midwives Act, 1918.

Correspondence

Treatment of Peptic Ulcer

- SIR,—The annotation in the *Journal* of May 8 (p 980) on the treatment of peptic ulcer draws attention once more to the poor results of such treatment, whether by medical or surgical means.

I would humbly indicate the probable explanation of this unsatisfactory condition of affairs which I have discussed in a recently published book, *The Colon as a Health Regulator* (price 2.50 dollars. The Macmillan Company, Toronto, whose London representatives are Macmillan and Co., Ltd.) My book was written with the intention of strengthening the chorus of widely separated voices crying in a wilderness of disinterestedness or even disbelief with regard to a condition complex which has pronounced and often far-reaching effects on the human organism, including a definite relationship with peptic ulcer.

The poor results of gastric therapy which are recorded are not likely to be much improved so long as the attention of the therapists is directed to the stomach. Such persistent concentration is remarkable nowadays when it is evident that peptic ulcers are ordinarily or chiefly due to a variety of extragastric causes. The most important of these are in my opinion, certain abnormal mechanical arrangements especially of the large bowel which are developmental in origin and which are unsuitable for, and the effects of which are aggravated by the upright posture assumed by man. The glandular secretions muscular activity and nervous control of the gastro-intestinal canal are collectively or separately, likely to be adversely influenced by such conditions. Indeed my special observations on this matter, extending over about thirty years lead me to believe that most of the diseased conditions (possibly barring those in the true pelvis) for which the surgeon performs laparotomy are mainly and primarily due to these mechanical shortcomings which some surgeons regard as normal.

Healthy function and interrelationship of intra-abdominal organs can exist only when their anatomical arrangements are approximately normal. Anatomists whose observations have been made on unselected material have defined what is normal. Disease selects the material for the surgeon hence the occasional disagreement with anatomists. A large proportion of individuals do not attain anatomical normality. My belief is that the structural developmental deficiencies which they show are probably the main cause of gastric and duodenal ulcer and other trouble in the gall bladder and appendix for

which the surgeon opens the abdomen. The abnormal developmental conditions of such people are not suited to the upright posture. Successful therapy is accelerated when the patient assumes the horizontal posture, or has certain of his loose dragging organs supported by suitable belts or adequate operative measures. Four footed animals rarely suffer from gastric ulcer¹. So long as the primary cause of disease is neglected therapeutic results are likely to be unsatisfactory and evanescent—I am, etc.,

Montreal, June 5

HENRY M W GRAY

Prevention of Constipation

SIR—The sweeping generalizations and caustic comments of some of the correspondents who have discussed the prevention of constipation are not worthy of us. There is no panacea for this common and resistant complaint. Imagination for the sufferer and careful diagnosis in each case are essential for progress in its treatment.

Some such title as *colon tardus* rather than the word constipation should be applied to the case of an individual who carries on comfortably with an average action once every two days. It is rather a matter of slow rhythm than disease. There is, however, a genuine constipation when with such slow rhythm the faeces become too firm. The results are

(a) Strain and trauma to the anus. Piles and fissure are natural sequelae. (b) Feelings of heaviness and discomfort in the pelvis when the faecal mass resists expulsion. (c) Mild transient toxic effects, headache, lassitude, anorexia and a dry mouth may occur and will vanish after an evacuation. (d) In rare cases and during the latter half of life invalidism develops from chronic intestinal stasis. Toxaemia shows itself in the sallow wasted patient. (e) Neurosis and nervous debility.

The victims of this train of troubles are not mere creations of injudicious purgation though often their troubles may have been aggravated thereby. Among them, as in other diseases, a small proportion of introspective individuals exist whose complaint is imaginary, but the majority are genuine cases and may be helped by the following forms of treatment.

1 Daily exercise preferably out of doors of a kind that activates and shakes the body such as riding, tennis, etc. Primitive man derived help from his more strenuous life by the mechanical aids and stimuli to the nervous and circulatory systems which movement affords.

2 The diet should be mainly vegetarian and roughage may be tried and continued if helpful (for example Kellogg's bran).

3 Medicinal paraffin is a most valuable lubricant and emollient taken once or twice daily a tablespoonful after a meal as progress dictates.

4 When necessary enemata of a half to one pint of warm water may be given and soap can be added if necessary. This is more scientific than oral medication by aperients. It acts on the recto-colon where the delay is and does not distress the unoffending small bowel. It is a valuable stand by which gives the patient security and is likely to be needed only rarely to reinforce the ineffectual expulsive mechanism.

5 Explanatory talks the length of which will usually be inversely proportionate to the physical factor in the malady may help. They should dispel any misconceptions on the subject and help those who are inclined to magnify trifling disorders.

Sympathectomy lumbar and presacral has been tried with little benefit. Right or even left hemicolectomy is applicable in the most aggravated cases in which radio-graphy shows the barium meal delayed two or three days in a stagnant right or left hemicolon. The operation has been wholly successful in six cases of mine and

produced a natural daily action in patients aged from 42 to 63 years who had had inveterate constipation. The patients have been well pleased. One was a woman who had derived no benefit from the sigmoidostomy done in France. Another male patient had been discharged from a large private clinic with the advice that he was not to think so much about his bowels!—I am, etc.,

Bristol June 13

A WILFRID ADAMS

SIR—I should like to thank Drs H Letheby Tidy (*Journal* May 29, p 1134) and F Parkes Weber (May 8, p 996) for their encouraging letters. The most interesting point raised in the correspondence on the prevention of constipation is the psychological question, Does constipation exist except as a result of mass suggestion?

Habitual constipation commonly begins as the result of an "acute" attack, which in many cases is continued because of the purgative habit. The defaecation reflex is disorganized and a vicious circle started. Omitting the purgative has not been sufficient to restore the reflex in many of my patients. As the causes of acute constipation are often recurring—for example, acute illnesses, pregnancy, neglect of the defaecation reflex, the abuse of purgatives for imagined ailments, etc.—it is reasonable to assume that a proportion of the patients concerned tend to develop habitual constipation. The 121 patients with habitual constipation included in my follow up—of whom 75 per cent. were women—represent approximately 3 per cent. of all my patients, and a further 1 per cent. must be added for the patients not followed up. I find, therefore, that 4 per cent. of that section of the community who have sought my advice in general practice gave a history of habitual constipation.

I would suggest to your correspondent "Mag Sulph" (*June* 12, p 1231) that not many of his 500 men were likely to suffer from habitual constipation. I doubt whether he would obtain similar results with 500 women. His avoidance of purgatives is laudable, and if more hospitals were to adopt this principle fewer patients would date their habitual constipation from their attendance at hospital. Before the advertising of aperients can be effectively countered a great deal of reform is necessary inside the medical and nursing professions. The history of medicine shows that the enthusiasm for depletion by venesection, emesis, diuresis, and purging has been slow to yield to rational methods. Of these treatments purgation is supported by the strongest advocates and lingers the longest (Professor Witts on Ritual Purgation, *Lancet* February 20, 1937).

Dr Robert Hutchison has been cited as an advocate of the use of purgatives (*Journal* February 22, 1936 p 374). He states that "drugs are usually indispensable and do no harm." This is contrary to the teaching of Sir Arthur Hurst who for years has been waging a crusade against the habitual pill taker (*Lancet* June 29, 1935). The fact that such an acute observer as Dr Hutchison has no high opinion of the dietetic treatment of constipation is probably explicable on the grounds that the patients with constipation that he sees in his consulting practice are a selected group—selected by their severity and hypochondriasis—and are not suitable material on which to form an opinion as to the treatment of the ordinary habitual constipation which is encountered in general practice.

I think that time will show the practical value of a high fibre diet for the prevention of constipation. My inclusion of salines amongst the undesirable habitual treatments of constipation was deliberate and I hope not prejudiced. There is a vast difference between the action of salines and

the action of mechanical laxatives which retain moisture within their substance. My experience of patients who take salines is that they have numerous minor ailments, particularly colonic flatulence, mild colicky pains, nervous irritability, and a liability to purgation followed by constipation. I have suggested bran as an alternative to thirty patients who were taking salines for habitual constipation. The fact that none of these patients have returned to regular salines, and only a few take an occasional "dose," is to my mind strong clinical evidence against the saline method—I am, etc.,

Broxbourne, June 14

E M DIMOCK

Health Problems in Malta

SIR—In your issue of June 5 (p 1179) Dr G Arbour Stephens raised the problem of the high mortality rate among the infants and children in Malta, which he attributes to defects of feeding caused by an insufficiency of good milk and fresh vegetables.

May I point out from the start that the problem is a much more complicated and difficult one to solve? Among the factors responsible the following should be remembered: (1) the overcrowding caused by a population of 2,434 persons per square mile; (2) the high birth rate of nearly 34 per 1,000; (3) the inclement weather during hot rainless summers which exceed four months in duration; and (4) the limited economic resources which entail a low standard of living among the poorer classes. Many mothers lack a good education, but it is always difficult for them to pay enough attention to their infants when they must cater as well for a family of six or seven other children with only their husbands' very limited earnings.

There is also the problem of proper feeding. Goat's milk is not used for infants on such a large scale as might be supposed, and if it were it might be preferable to many of the cheap artificial milks actually on the market—I am, etc.,

Floriana, Malta, June 10

WALTER GANADO

SIR—I read with particular interest the letter of Dr G Arbour Stephens dealing with infant mortality in Malta in which he attributes the high mortality rate among children to lack of vitamin B in their diet. As a local medical man who has had the opportunity to study the question on the spot I beg to differ. Of course lack of vitamin B in foodstuffs and bad nutrition in general, both in the pregnant mother and in the child, play a part, and a good one at that, in bringing about that appalling death rate which reflects so badly on our sanitation; but this is only a contributory cause. The real cause of infant mortality in Malta is overpopulation. All other causes (bad feeding, uncleanness, infections, etc.) follow in its wake and help to increase its ravages. Malta is a small island with the densest population in Europe, and a birth rate which surpasses by far that of any other country, and is out of proportion to our economic wealth. Our birth rate, which needs no alleviation of taxes and distribution of prizes to be encouraged as is done in other countries, is very high and alarming, only the usual indifference of the British Government and the fatalistic attitude of our own people not alarmed.

High infant mortality follows invariably overcrowding. If the high birth rate was common among the well-to-do or at least distributed equally among all classes of the population the infant mortality would not be so high. But it is especially more marked among the lower classes who cannot be expected to understand the responsibility of their actions and are incapable of being

morally and economically, of rearing large families. Usually young people of the lower classes and in the rural districts get married too early with the result that at the end of their period of fertility they can claim an average of fifteen to twenty children between dead and alive. They have to house, feed, clothe, etc., all this family on an average of 4s per working day. They have no hobbies and can afford no entertainments, their only enjoyment in life is sexual intercourse, which they practise without any moderation and without any thought for their future children. The natural consequence of this state of affairs is that after a few years of married life the mother has to look after six to eight children and the father has to pay for their needs. Generally they both fail in their duties, the mother, occupied in her housework, leaves her infants in the custody of the elder children, while the father, having spent long hours to earn his pitiful wage, has hardly any energy left for extra work to meet the demands put on him by his large family. Hence neglect of infants, malnutrition, lowered vitality, infections, and death.

From the above it is clear that fresh vegetables will not solve Malta's problem of infant mortality nor will any amount of artificial sanitation do it. In my opinion Malta is unable to rear the number of children that are born on it. So long as the birth rate remains so high so long will our infant mortality beat all records in Europe.

This is our diagnosis. What about the treatment? Reduction in our birth rate. How? Birth control is out of the question, as we Roman Catholics consider it anathema. The best thing that could be done is to dissuade young people from marrying early, bringing before their eyes the great responsibility they take in doing so, and to persuade married couples with yearly offspring to periods of sexual abstinence, or at least the practice of the safe period. Besides some social legislation to help the lower classes some increase in wages where and when possible, and above all emigration, will help. This last question emigration should concern the British Government. We are not expecting from London any help in finance or fresh vegetables, but with a little good will a lot could be done in finding an outlet for our surplus population and in helping us solve our problem of infant mortality, which is a serious blot both on the home Government and on the fair name of this little island—I am, etc.

Valletta, Malta, June 17

JOS BONNICI

Angina Innocens

SIR—Submammary tenderness is common enough especially in middle-aged women with a tendency towards obesity. Most people pay no attention to it, only in nervous subjects does it lead to pain, and the severity of the pain bears a strict relationship to the anxiety and the sensitiveness of the patient. The site of the tenderness is in the chest wall. The cause is uncertain, although in many cases a thickening of the subcutaneous tissues may be felt and rapid relief can usually be obtained by massage following the removal of any septic focus. Pain is likely to be noticed on exertion owing to the increased movements of the chest and the enhanced activity of the intercostal muscle. Although the position of submammary pain makes it easy to differentiate from angina, difficulties may arise when the pain is felt and the tenderness is found in the third and fourth intercostal spaces immediately to the left of the sternum. This pain and tenderness has been recorded by Bence Jones (1927, 1, 855) to be one of the symptoms of a certain type of angina.

ness is found just as commonly in the right hypochondrium, where it should be distinguished from tenderness due to lesions of the gall bladder

Angina has long been used to denote pain arising from the heart. Whatever may be the underlying cause of submammary tenderness it has nothing to do with the heart, and there would seem to be as little justification for the use of the term "angina innocens" in these cases as for "pseudo angina" and "secondary angina," now happily fallen into obscurity—I am, etc.,

Harrogate June 14

Early Diagnosis and Treatment of Heart Failure

SIR—I have read with much pleasure and profit the article on early diagnosis and treatment of heart failure by Dr William Evans (*Journal* June 5, p 1145). It bears the stamp of lucidity and common sense so characteristic of the writer's method of teaching, but while emphasizing the need for early recognition of heart failure, Dr Evans omits to mention the common clinical symptoms of nausea and vomiting which I regard as among the earliest signs pointing to the heart as the cause of the trouble. In many years of general practice I have come to look upon this clinical symptom of vomiting as of the utmost importance. I have met it in many cases of heart failure resulting from mechanical causes, but more often in toxic cases particularly in diphtheria and lobar pneumonia.

Dr Evans has discussed heart failure resulting from mechanical obstruction in the heart itself, as in mitral stenosis, aortic stenosis, etc., also that complicating hyperpiesia, emphysema and bronchitis, but he has omitted to tell us of the heart failure resulting from toxic conditions such as acute lobar pneumonia, erysipelas, the fevers, and, particularly, diphtheria which most concerns the general practitioner. It is not the breakdown of a mitral stenosis or the paroxysmal nocturnal dyspnoea of our hyperpiesics, but the acute heart failure of cases of pneumonia and of fever that try us.

Anyone who has had charge of a diphtheria ward will bear out what I say regarding vomiting as an early sign of impending cardiac failure. Even in patients known to be suffering from heart disease apart from undue breathlessness on exertion, or the brisk haemoptysis of a mitral stenosis, a complaint of persistent nausea and occasional vomiting or even an unaccountable indigestion should at once direct attention to the heart. I have known such patients be put on a milk diet and a bismuth and soda mixture instead of being put to bed and given digitalis. Digitalis is without doubt the best drug for mechanical failure but in toxic cases especially pneumonia, it is useless. Taking acute lobar pneumonia as an example when circulatory failure threatens far from finding that strychnine, camphor and pituitary have far survived their usefulness as Dr William Evans suggests, I have found them life saving. I have found especially useful 1 ccm doses of pituitrin given every two or three hours. It raises the blood pressure and although the effect is temporary by repeating the dose frequently we help to tide the heart muscle over a crisis. Strychnine does good indirectly by stimulating the vasomotor nerves and so raising the blood pressure. Camphor as coramine is less certain and must be given in fairly large doses (3 to 4 ccm) every few hours but in the cardiac failure of acute pneumonia it can sometimes be most useful—I am etc.

Bournemouth June 17 VINCENT NORMAN M.D., M.R.C.P.

Cancer of the Oesophagus

SIR,—I hope that my mentor, Mr Herbert Tilley, will not object to a respectful word of difference from one of his disciples. I was surprised at the statement in his article on cancer of the oesophagus in the *Journal* of June 12 (p 1199) that he could not out of his vast experience, 'call to mind a single patient who did not succumb to the disease within twelve months from the commencement of treatment (by means of radon seeds). We have been working intensively at this method, and out of our relatively small number of cases—fifty or sixty in all—we have had two three year survivals—one had a recurrence after this interval, the other died in his sleep without further symptoms. I recently saw two patients, both of whom had been treated by the insertion of radon seeds nearly eighteen months ago. One was treated through the mouth, and his obstruction was then returning, so he probably has had a recurrence. The other, who was dealt with by combined per oral and retrograde transgastric methods, was perfectly well and could swallow without difficulty.

Deep x ray therapy can it is true produce some very fine results, at any rate for the time being but I have seen too many cases of severe malaise during what is a fairly prolonged treatment, together with the serious complications mentioned in Mr Tilley's article, to be convinced that it is the treatment of choice in the usual case of the poor debilitated old man, particularly as the extent of his increased expectation of life is still somewhat doubtful. After all, the insertion of seeds through an oesophagoscope is a minor operation entailing no upset to the patient and will in most cases give the patient back his power of swallowing which is what he wants.

I freely admit that the majority of these cases do not, as Mr Tilley says see the first anniversary of their treatment, in fact most of them are dead within six or nine months. Such cases as the above, however, and also the healed scar which I am sure Mr Tilley has seen on oesophagoscopic his patients afterwards prove that radon seeds can destroy the growth, but, as he points out, seeding through an oesophagoscope is a haphazard attempt at even distribution of the seeds throughout the growth. It may be that a combination of seeding and x rays will prove better than either alone, the first lessening the amount of the second which is necessary, and thereby diminishing unpleasant reactions and complications.

Mrs Hilton is to be congratulated on the result of her case mentioned in the *Journal* of last week, but it would be interesting to know the average increase of life she attains with deep x rays, and the percentage of real improvement in swallowing—I am etc.

Guildford June 16

G H STEELE, M.S., F.R.C.S.

Ionization for Hay Fever

SIR,—It is a recognized fact that sufferers from those symptoms to which the diagnostic label of 'hay fever' is attached usually belong to the more leisured classes. This probably partly accounts for the fact that our hay-fever patients are relatively more commonly seen in the consulting room than in the out-patient department. So far as my personal experience goes this is not the case with vasomotor rhinitis of the non seasonal type. I still see a good many of the latter in the out-patient department, and it is a humiliating confession that in neither class of case can I satisfy my conscience that any improvement in the patients' condition can be undoubtedly

scribed to the effect of my treatment. I make this statement advisedly, because there are few conditions within my knowledge which suddenly for no apparent rhyme or reason may improve or disappear whilst undergoing no form of therapy whatsoever. This was so in my own case, when after undergoing every conceivable form of treatment for an intractable hay fever I wearied of trying to get well, and can now mow my lawn without a sneeze.

The point of this letter is to try to find out why it is that my own experience of the results of treatment by 'ionization' are apparently so very different from those reported by others. One is tempted to think that only the few failures happen to come within my ambit. In a very recent French textbook on the diseases of the nasal fossae, in which the subject of vasomotor rhinitis was very fully discussed, no mention whatever was made of treatment by ionization. What does it all mean? I trust my experience is unique. Or is it shared by some others?—I am, etc.,

London, W 1, June 15

MICHAEL VLASTO

Hobday Research Endowment Fund

SIR,—An appeal has been launched for funds for the purpose of making a presentation to Sir Frederick Hobday on his retirement from the position of Principal and Dean of the Royal Veterinary College as a mark of appreciation of his services to veterinary science in general and the Royal Veterinary College in particular.

Sir Frederick has intimated his wish to devote the sum raised to the furtherance of the collaboration between the medical and veterinary branches of medicine in their mutual crusade against the diseases of animals which are common to, or communicable between animals and man. Since the preliminary letters were issued the method of carrying this out has been considered by Sir Frederick, and he has intimated his desire to found a Research Scholarship Fund in order to encourage research by veterinary and medical men in connexion with the diseases of animals and man, which research it is hoped will further the liaison between the two professions and be of great benefit to the science of medicine in its widest sense—the fund to be called the Hobday Research Endowment Fund.

The committee feel that these details, and particularly the idea itself, will be of the greatest interest to members of the veterinary and medical professions. It is hoped that among his numerous friends and well wishers a substantial sum will be raised which will be sufficient to enable this scheme to be carried out adequately.—I am, etc.,

E. T. COV
Hon. Secretary

St Ermins Westminster SW 1 June 19

Animal Pathology

SIR,—In reference to Dr Tom Hare's remarks (*Journal* June 12 p 1229) on your leading article, I can quote a case where a medical practitioner did score off the veterinary profession.

Blackhead is a very deadly disease in turkeys, and apparently salvarsan and the various imitations thereof had been neglected in this disease until suggested by a local practitioner here. I understand the use of these arsenical preparations is now general in this condition.—I am, etc.,

Haslington Crewe June 19

Empire Conference on Tuberculosis

SIR,—The success of the Empire Conference on the Care and Aftercare of the Tuberculous promoted by the Overseas League and the Papworth Village Settlement has manifested itself in many ways, and the enthusiasm shown has exceeded all expectations. This is naturally most gratifying and I would not ask you to publish this letter were it not for an announcement made last week by the Joint Tuberculosis Council (*Journal* June 12, p 1225). This council have already offered their help and co-operation to the standing committee of the Empire Conference and the president of the conference the Marquess of Willingdon has gladly accepted their offer.

The Joint Tuberculosis Council now announce that they have formed a committee to consider what help this council can give the Colonies in their efforts to control tuberculosis. This seems to indicate that their enthusiasm for the cause has led them to misunderstand the objects of the Empire Conference, which consist in the mutual and personal exchange of knowledge and experience among tuberculosis workers in every quarter of the British Commonwealth of Nations. Whether the help of the council is intended to be in the form of funds or of information and advice I do not know, but financial help was never asked for, and if it were required there are already in existence official channels for such succour. As for the question of giving information, the Conference showed that the over-seas delegates were in possession of a vast amount of knowledge of their own particular sphere of work and that they were more than ready to put this at our disposal.

Were it not for the publication of the names of this new committee including those of three delegates who were especially invited to attend and speak at the Empire Conference, I should not, Sir, take this step of writing to you but I am anxious that our many friends over-seas and the heads of the Government departments concerned should know that the spirit and meaning of the Empire Conference has not changed, and that mutual service is its keynote. We have, as workers in the tuberculosis field, as much to receive as we have to give, and it is in this spirit that the standing committee of the Empire Conference is proceeding with the negotiations entrusted to it by the conference where, at the sixth session, the chairman Professor S. Lyle Cummins proposed a resolution which met with acclamation and unanimous approval. It is the present duty of the standing committee to place this resolution before those for whom it was primarily intended.—I am, etc.,

PENDRILL VARRIER-JONES
Joint Convener of the Empire Conference
on the Care and Aftercare of the
Tuberculous

Air Raid Precautions

SIR,—Is it not a pity that eminent members of our profession should damn with faint praise and even hold up to ridicule the efforts that are being made in the name of humanity, on the tremendous problem of air raid precautions—a problem to which some of the best brains in the country are being devoted?

It is strange to note how Professor Ryle and Drs Joules, Leys, and Ladell hasten to agree with each other, and yet, while Dr Ladell refuses to take part in air raid precautions, Professor Ryle mentions the 'one indisputable duty for doctors' to help the stricken multitudes. Professor Ryle talks contemptuously of playing at gas

attacks. How on earth can he or anyone else be efficient in helping the stricken multitudes if he has not done a gas course and learned the elementary principles of respirator drill, decontamination, etc? He infers that his conscience cannot justify his lecturing to lay audiences. I take it he would not withhold any knowledge he happens to possess of defence against gas from members of his own household. Why, then, should he withhold it from others, or be at all tiring with his conscience for doing so? He would try to decontaminate his own house wouldn't he? Why should he be conscience stricken if he lectures to Bill Smith on how to do the same?

Dr Ladell uses the expression "mass murder" three or four times in one letter. War is war, unfortunately, whether it is called murder or not, and I for one am perfectly prepared to put myself at the service of the armed forces of the Crown, whose job it is, among other things to shoot down and kill enemy airmen who are attacking this country.

I may be accused of aggressive militarism. May I make it clear that I abhor the idea of war. I hope and pray that war will never come. But I feel that this carping criticism of the air raid precautions, these suggestions of not lifting a finger to help our country in time of need, are to be condemned. I am certain that the vast bulk of the profession to which I have the honour to belong will if the time comes, do their duty, as they did it twenty years ago with dignity and with gravity, and in the spirit of the old tradition—I am, etc,

W A BELLAMY

London SE26 June 11

Lieutenant R.A.M.C.(T)

SIR—The letters of Dr Leys and Dr Macdonald Ladell in your issues of May 22 and June 5 have performed a useful service in bringing before the members of the medical profession the problems of air raid precautions. In support of their opinions may I quote the following extracts from recent publications. In his book, *Towards Armageddon* Major General Fuller writes: "I consider that gas masks will prove a god send—not that the enemy is more likely to use gas bombs than high explosive and incendiary bombs, but because they will give terror stricken people something to do. In any case, once they are adjusted they will prevent those wearing them shrieking and moving freely, and if they half suffocate their wearers, anyhow panic will be rendered suffocated in its turn." Again, in *Death From the Skies* Heinz Liepmann comes to this conclusion: "The more elaborate the experiments that have been made to discover protection against gas the more obvious has it become that there is no effective protection whatever."

Regarding protection against high explosive and incendiary bombs an expert lecturing to a medical audience informed us that owing to the thickness of concrete required to make a building proof against high explosive bombs there was no adequate protection possible for the civilian population. Incendiary bombs were to be rendered harmless by removing all furniture from the top flat of each house and covering the floor with earth to a depth of six inches. The utter futility of this suggestion, when applied to a densely populated area is apparent.

Might I suggest that in view of the gravity of this matter the B.M.A. appoint a committee to inquire into the efficiency of the air raid precaution scheme. Should the committee find the scheme as worthless as many of us believe it to be let the B.M.A. speak in no uncertain

voice against medical participation in a deliberate deception of the people.

If the full implications of aerial warfare against the civil population were even partially visualized by the general public, the people of the British Isles would make it their business to prevent an English Guernica, no matter what the cost—I am, etc.,

WILLIAM COLQUHOUN M.B.

Dunmurry, Co Antrim June 15

SIR—The main fallacy underlying Dr Frewen Moor's letter appears in the statement that poverty in the modern world is not due to lack of goods, for it is evident that in "goods" he includes food. I submit that the fertility of the world's inhabitants, thanks mainly to the Asiatics, is still so high that the rate at which they increase their food supply would need to be doubled or trebled if there were to be enough for all the adults and children and all the new mouths added annually. Dr Moor himself says that England is one of the richest nations and yet has a third of its population starving. While the world continues to have such a pressure on the means of subsistence we must needs study air raid precautions until the League of Nations can protect us—I am, etc,

London SW June 21

B DUNLOP

Osteopathic Colleges

SIR—It is idle for Dr Kelman Macdonald to pretend now that the promoters of the defunct Osteopathic Registration Bill of 1935 did not give their fullest sanction and support to the subsequently gravely discredited British School of Osteopathy in view of the fact that the Bill proposed that of the eight members of the Osteopathic Board to be constituted two should represent that school—one the 'graduates,' and one the governing body.

I pointed out that chiropractic, a cult obviously very similar in character to osteopathy but much more recent in origin, had twice as many adherents in the United States at present, osteopathy therefore, I said, was fighting a losing battle. As Dr Macdonald admits this ratio it is irrelevant to the argument to try and explain it away by suggesting reasons for it, for which incidentally others than those he adduces have been put forward. Much the most probable explanation is that osteopaths have tried to be imitators of the orthodox medical practitioner at the same time as claiming that they had an alternative and better method of dealing with disease. They have thus fallen between two stools, chiropractors have not made that mistake and are scoring in consequence.

Dr Kelman Macdonald evades the principal statement in my letter—namely, that the American osteopathic schools claiming to give adequate instruction in the medical science fall immeasurably below standards obtaining in the reputable medical schools in the United States and I may add now in Canada. The quotation from Sir Robert Stanton Woods contains no reference to schools and has no relation to this issue. In conclusion may I point out that the osteopaths in this country seeking registration have had ten years in which to comply with the requirement stressed by Mr Neville Chamberlain—namely that they should establish reputable schools in this country and they have not begun to do so. When we may ask, will the time be 'ripe' to supply this deficiency? Until this essential condition for registration is fulfilled Dr Kelman Macdonald and his friends are merely beating the air—I am, etc,

House of Commons June 21

E GRAHAM LITTLE

Medical Notes in Parliament

The House of Lords on June 17 read the Liverpool United Hospital Bill and on the same day it was read a first time in the House of Commons. Its purpose is to amalgamate the Liverpool Royal Infirmary, the David Lewis Northern Hospital, the Royal Southern Hospital, and the Liverpool Stanley Hospital. In the same House on June 21, the Ministers of the Crown Bill passed through Committee without amendment.

The Physical Training and Recreation Bill was read a third time in the House of Commons on June 11.

The Report of the Lord Chancellor's Visitors in Lunacy for the period October 1, 1936, to March 31, 1937, has been presented to Parliament.

Regulations laid on the Table of the House of Commons on June 22 included the National Health Insurance (Medical Benefit) Amendment Regulations (Scotland), 1937, the Dangerous Drugs Regulations, 1937, and the Raw Opium, etc., Regulations 1937.

On June 22 Sir Kingsley Wood introduced the National Health Insurance (Juvenile Contributors and Young Persons) Bill which amends the National Health Insurance Act, 1936, makes certain persons under 16 eligible for medical benefit, and facilitates the provision of medical benefit to such persons and other young persons.

Education Estimates

In committee of the House of Commons on June 14 the vote for the Board of Education was discussed. Mr KENNETH LINDSAY in introducing the vote said that the total increase in the vote over last year was £1,296,233. Part of the increase was due to general maintenance charges. There was another item provision for physical training under the Government's new scheme but that provision would be made in a supplementary Estimate. During the last eighteen months provision had been made for the youngest children by way of 7,500 nursery schools in eighty different areas. Fifty new schools with playing fields attached in 1935-6 and during the last year ninety such new schools were approved. During the last two years 111 playing fields had been acquired for separate schools and sixty-one to cater for a variety of schools had been acquired. Gymnasias had been provided for 117 elementary schools.

There had been progress along many lines of advance in regard to the school medical service of physical education. Since the recent circular was issued thirty four new proposals and five proposals for enlarging existing nursery schools had been received. The present position was that eighty nine nursery schools were recognized by the Board of Education and in addition thirty-one had been approved in principle and ten were under consideration. While the growth was rapid in proportion the total was still comparatively small and there were many areas where local conditions would justify providing these schools but where proposals had not been received. Their object was to obtain for all children under 5 years of age whose home conditions were unsatisfactory light airy rooms, special playgrounds play material and a happy environment which they needed for normal physical and mental development.

SCHOOL MEDICAL SERVICE

The school medical service was a wonderful service but it needed more staff. Since the recent circular was issued thirty two authorities had increased their staffs by the appointment of six whole time and twenty nine part time medical officers twelve authorities had appointed aural and eight ophthalmic specialists and one a specialist in rheumatism. One hundred proposals had been received for building school clinics and extending old ones and there were thirteen new schemes for

orthopaedics nineteen for aural treatment and fifteen for artificial light treatment. These were examples of how the staff was being increased but there was still leeway to make up. At the time of the issue of the circular it was estimated that there were less than two thirds of the number of school dentists required but sixty-one authorities had increased their staff by employing sixty two full time and twenty-three part-time dentists. The ideal they must achieve was an annual inspection of all school children otherwise he did not see how they could make good progress in this which was probably one of the most important aspects of the health services.

There were also day open air schools residential schools for delicate children, and the problem of the feeble minded was always with them. It was particularly difficult to deal with in the countryside. For some children the only solution was the residential school and on that score one new proposal had been received from a country district.

PHYSICAL EDUCATION

A number of training colleges had established advanced courses of physical training for their students. Out of 315 education authorities 178 had appointed physical training organizers. This meant that three quarters of the children in the country were in areas where there were physical training organizers.

Sir ERNEST GRAHAM LITTLE hoped that pasteurized rather than raw milk would be supplied in the schools. It was hopeless to contend against the overwhelming opinion on this subject. It was disappointing to learn that 800,000 children who in 1934-5 were reported as requiring it did not receive dental treatment. The situation was made still worse by the fact that only three fifths of the children in schools were inspected. He had authoritative information that in large numbers of cases the dental examination was both infrequent and perfunctory. They had a large volume of dental disease that was not detected and much that was not treated. He did not often agree with the London County Council but he thought their regulations for the dental inspection of school children might be regarded as a model.

A motion to reduce the vote was defeated.

Pensions for Local Government Officers

Sir KINGSLEY WOOD moved in the House of Commons on June 11 the second reading of the Local Government (Superannuation) Bill. He said it was designed to amend and extend the law relating to the superannuation of local government employees and also consolidated and qualified the existing law. The main object of the Bill was to secure reasonable uniformity in the provision to be made by local authorities for pensions for their staffs. It required provision to be made for the superannuation of all the whole time local government officers, and facilitated similar provision by local authorities relating to pensions for their other employees. The Bill brought the local government service in this respect into line with the long-established practice of the Civil Service. Officers looked for opportunities for advancement over the whole field of local government service and the absence of a superannuation scheme often restricted the number of suitable applicants for vacant posts. Provision was made that a married employee in return for surrender of part of his pension could secure an annuity for his widow for life and a female employee might make similar provision for the surviving husband. Provision was also made for transfer with full preservation of rights from the service of one local authority to another. Some modification of the actuarial basis of local government superannuation so far as future entrants to superannuation schemes were concerned was necessary in view of the change in interest rates since 1922. It was proposed that the appointed day under the Bill should be April 1 1939.

POSITION OF MEDICAL OFFICERS

Captain G S ELLISTON said that the Act of 1922 had been adopted by a majority of local authorities and its advantages were enjoyed by 350,000 designated officials, but there remained 587 local authorities and 20,000 officers who did not enjoy the advantages of superannuation with the result that

elderly officers were retained when no longer efficient for their duties. He was disappointed that no provision was made for the optional grants of added years by local authorities in the case of their professional officers. He had special experience of the conditions of service of medical officers. These men spent five or six years in acquiring their professional qualifications. At the end of that period they went for a period as house physician or house-surgeon in a hospital and then they had to acquire the further professional qualifications which enable them to take a public health appointment. In view of the varied character of public health work in these days a medical officer who hoped to secure a principal appointment had to acquire special experience in a number of directions. He might spend a period of residence in hospital in some cases he would serve for a period in a tuberculosis sanatorium. He had to acquire extra experience perhaps in diseases of women and children and in other directions. That meant that he was usually 30 years of age or more before he could obtain his first appointment. Owing to this late entry at a higher salary level the contributions of these officers in relation to their pensions were much higher than those of non professional officers. He asked the Minister to consider whether he could give local authorities the power if they so desired to add years not exceeding ten to the number which professional officers in such circumstances had actually served. Alternatively it was suggested that years spent in professional training should be allowed to count as service years within the meaning of the Act.

He knew the anxiety of the Minister to promote co-operation between the municipal hospitals and the great voluntary hospitals. Some members in that House would like to see it made possible by this Bill to provide for the interchangeability between the federated superannuation scheme of the voluntary hospitals and the superannuation scheme of local authorities. If this were practicable it would undoubtedly facilitate the interchange of personnel and raise the standard of the hospital services.

Mr W H GREEN regretted there was practically no distinction in the Bill between permanent and temporary employees. The London County Council had 3 400 nurses on probationary service and under the Bill these would be immediately placed under the superannuation scheme although many of them would drift out of the service.

SUPERANNUATION OF MIDWIVES

Sir FRANCIS FREMANTLE said among civil servants were men of the highest possible attainments, recruited largely from the universities and he wished to get the same type of men into local government service. One of the obstacles hitherto had been the absence of superannuation. Under the Bill the transition from one to the other might be made more easy. Voluntary associations were run with great public spirit but for a continuation of service a superannuation fund was necessary. The arrangements in the Bill were not satisfactory for bringing in the midwives who while working under associations in villages, were at the same time under a contract with the county council under the Midwives Act to provide a midwifery service. It was difficult to recruit the service of midwives and he urged the Minister to give consideration to the question of enabling them to secure the full advantages of superannuation.

Mr BERNAYS replying to the debate, said that in committee Sir Kingsley Wood would present an amendment to ensure beyond doubt that service qualifying for superannuation included war service.

The Bill was read a second time without a division and sent to a standing committee.

THE SCOTTISH MEASURE

The Local Government Superannuation (Scotland) Bill was brought up for second reading in the House of Commons on June 10 by Dr ELLIOT. He said it amended and consolidated existing statutory principles and its main new proposal was that superannuation should be compulsory in the case of all whole time officers of local authorities in Scotland. The term embraced administrative and professional officers and also

the clerical staffs. Of those officers 70 per cent were covered by schemes voluntarily adopted by local authorities under the Local Government and Other Officers Superannuation Act 1922, and by local Acts. The remaining 30 per cent numbering about 4 400 would be covered under the Bill. Local authorities would retain the discretion they already possessed to superannuate their other employees but the machinery for bringing them into superannuation would be improved. All past service would be reckoned for superannuation and periods of unemployment with absences on sick leave involving reduction of pay would be ignored. Where small towns had fewer than fifty whole time officers in their employment, these officers for the purposes of the Bill would be treated as employees of the county council. The day from which the Bill would operate was May 16 1939.

The Bill was read a second time without a division, being thereafter committed to a standing committee.

Maternal Mortality in Wales

On June 15 Mr J GRIFFITHS asked the Minister of Health what was the maternal mortality rate for each of the administrative counties and county boroughs in Wales for 1936 and the corresponding rate for England and Wales as a whole. Sir KINGSLEY WOOD circulated the following table.

Maternal Mortality Deaths for 1936 per 1,000 Total (Live and Still) Births		
	Puerperal Sepsis	Other Puerperal Causes
England and Wales	1.34	2.31
Cardiff C.B.	2.55	1.13
Merthyr Tydfil C.B.	1.02	—
Newport C.B.	0.59	1.77
Swansea C.B.	2.22	4.44
Administrative Counties		
Anglesey	1.30	5.20
Brecknock	1.25	4.99
Caernarvon	2.38	4.17
Cardigan	1.48	7.42
Cardiff	1.54	5.01
Denbigh	0.83	2.91
Flint	2.04	3.58
Glamorgan	2.42	2.92
Merioneth	—	1.82
Monmouth	2.96	3.52
Montgomery	—	1.43
Pembroke	2.25	1.50
Radnor	—	3.07

Ophthalmic Benefit Regulations

Sir ERNEST GRAHAM LITTLE asked on June 9 whether the National Ophthalmic Treatment Board was taken into consultation in the drafting of the Additional Benefits Amendment Regulations, 1937 and whether the arrangements made by these regulations for permitting sight testing by recognized opticians would in any way interfere with the development of the best possible ophthalmic medical service in this country.

Sir KINGSLEY WOOD said that before the Regulations were made the fullest consideration was given to the views expressed on behalf of doctors associated with the work of the National Ophthalmic Treatment Board. He saw no reason why any arrangements made under the Regulations should interfere with the development of a satisfactory ophthalmic medical service.

On the same subject Major H A PROCTER asked on June 10 what steps had been taken to obtain agreement between the sight testing opticians and the National Ophthalmic Treatment Board with regard to the question of sight testing in connexion with ophthalmic benefit. Sir Kingsley replied that repeated attempts had been made to obtain agreement between the different schools of thought on the subject. He himself had received representative deputations from both sides. Unfortunately it was not possible for any agreement to be arrived at.

Ophthalmic Treatment of School Children

Mr KENNETH LINDSAY announced on June 17 that during 1936 166,257 children attending public elementary schools in England and Wales were provided with spectacles under

arrangements made by local education authorities. With the exception of the authority for the Isles of Scilly all local education authorities had arrangements for the treatment of defective vision by a qualified medical practitioner who had had special experience in ophthalmic work. All children in whom any defect of vision had been found were re-examined from time to time. The interval between the examinations depended on the nature and extent of the defect.

Mr MACQUISTEN asked whether one of the causes of bad sight was not the fact that the small type of school books caused myopia.

No answer was returned.

Typhoid in Spanish Refugee Children

Sir ARCHIBALD SOUTHEY asked on June 10 how many Spanish refugee children had been admitted into this country and how many cases of typhoid or suspected typhoid had occurred among them. Sir KINGSLEY WOOD said that according to information with which he had been supplied 1881 children arrived at the camp at North Stoneham on May 23 and 24. Six cases of typhoid, including one not finally diagnosed and one of paratyphoid had occurred among them. Three children were at present under observation for this disease. A first inoculation against typhoid had been given to nearly all the children in the camp. The responsibility for the conduct of this matter rested with the voluntary committee. His department had given all the advice and assistance that could be given, and would continue to do so. He was anxious that, subject to satisfactory medical conditions these children should leave the camp as soon as reasonably practicable and possible. Any assistance that his medical officers could give to medical officers in districts where they had to go in order to ensure safety so far as health was concerned, would be given. Medical officers of health would be informed before arrangements were made to transfer these children. He believed that the medical officers were fully alive to the need for carrying out their duties.

In a previous reply Sir Kingsley Wood said he was unaware of any instruction or request that the children from Bilbao should be vaccinated or inoculated before reaching this country. Approximately 50 per cent were found to have been inoculated against small pox.

"Scandal" of Housing Conditions in Scotland

In the House of Commons on June 10 Mr HENDERSON STEWART drew attention to the report of the Scottish Housing Advisory Committee on Rural Housing and read many excerpts on the bad housing in Scottish rural areas. The committee he said emphasized the need for regional water and drainage schemes. It pointed out that no section of the population was compelled to live in such consistently bad conditions as farm labourers. Investigations in a number of parishes regarded as typical of Scotland showed that 75 per cent of the houses visited there were unfit for human habitation.

Dr ELLIOT said he welcomed this report. Many of its recommendations involved legislation and he had given it full consideration in conjunction with the general housing problem. In Glasgow and Coatbridge housing conditions could be found altogether worse than those which had been brought out in rural housing. In Glasgow there were choked-up closets one two or three floors up with the sewerage running into the floors below polluting everything. He did not deny that in rural housing there was a lack of water and of food storage places but in the country there was sunshine and fresh air. The general housing situation in Scotland was one of the scandals of the century. One third of the population of Scotland was living without separate water closets. They could not concentrate on removing this scandal either from the country alone or from the town alone. They must advance against both. The rural slum was as great a disgrace as the urban slum, but not greater and if they concentrated all their efforts on it they would be wrong. He did not take a light view of this matter nor did his officers.

So far as recommendations calling for administrative action were concerned Dr Elliot was in general agreement with the report. He proposed to communicate with the county councils and ask them to take administrative action under the Housing (Scotland) Act and Housing (Rural Workers) Acts in advance of any legislation which might be introduced to carry out the committee's recommendations. Valuable work had been done under the Housing (Rural Workers) Acts, and the committee as a whole favoured the further extension of those Acts. The Housing (Rural Workers) Acts would not expire until June 24, 1938 and up to that date local authorities might receive applications for assistance. Although legislation extending the Acts would not be passed until the spring of 1938 there was no reason why there should be any decline in the amount of work done. The number of dwellings in respect of which town and county councils had received applications for assistance was roughly 30,000, and applications made to county councils covered about 27,000 of these. This compared with 20,000 applications for the whole of England and the number of dwellings on which work had been completed was 23,000 for Scotland compared with 11,800 for England. He trusted he might rely on the efforts of local authorities and members on all sides of the House in remedying the defective housing conditions in rural Scotland. He for his part would do his best in seconding any efforts that were put forward. The House then adjourned.

On June 15 Mr WEDDERBURN informed Mr Westwood that eight local authorities had indicated to the Scottish Department of Health that they proposed to postpone further housing developments involving approximately 1,584 houses.

Corporal Punishment—Sir Alfred Knox was told by Mr GEOFFREY LLOYD on June 10 that it would be the duty of the Committee on Corporal Punishment to take account of the regret expressed by the judge at Leicester Assizes that he had no power to order whipping in a recent case of brutal assault on a young girl.

Mr THURTELL: Will the Home Office consider taking powers to permit magistrates to order compulsory surgical operation in cases of this kind?

Sir FRANK SANDERSON: Does not the hon gentleman consider that this is a type of case in which sterilization might be of considerable advantage?

No answer was returned to these questions.

Dental Treatment of Unemployed—Sir KINGSLEY WOOD told Mr Whiteley on June 10 that he had received a communication from one local authority about the increased cost to public assistance committees of dental treatment and the provision of artificial dentures to persons in receipt of allowances from the Unemployment Assistance Board. Under the Unemployment Assistance Act the Board had no power to defray the cost of dental treatment.

Surgical Appliances for Poor Persons—Sir KINGSLEY WOOD told Mr Edward Strauss that he would not be justified in inquiring the probable cost to the State of the provision free of cost of surgical appliances to all poor persons whose need thereof was certified by a qualified medical practitioner. Local authorities had powers to render assistance in appropriate cases.

Ventilation of House of Commons—Sir PHILIP SASSOON told Mr A. C. BOSSOM on June 14 that investigations were proceeding into the best methods of improving the ventilation of the House of Commons chamber. It had not been possible to prepare a detailed scheme and he was not in a position at this stage to furnish an estimate of cost.

Noise and Health—Sir RALPH GLYN asked the Minister of Health whether he would appoint a committee to inquire into the detrimental effect of unnecessary noise on the health of people living in large cities and how far medical opinion supported the view that many instances of nervous breakdowns etc., were due to causes which could be to a great extent eliminated. Sir KINGSLEY WOOD said on June 14 that research into the effects of noise on workers carried out by the Industrial Health Research Board of the Medical Research

Council on which reports have been published, showed that it was very difficult to detect and measure any specific effects of noise on health and it was hardly possible to assess within the limits of a Parliamentary answer the influence which medical opinion would assign to the part played by noise in the increased strain of modern life. He did not think the subject lent itself to investigation by a committee as suggested.

Housing in Scotland—On June 15 Sir THOMAS MOORE asked the Secretary of State for Scotland whether, in view of the fact that over 250,000 houses were still required to replace unfit dwellings in Scotland, and that owing to the present condition of the building trade it would not be possible to erect more than some 25,000 houses per annum, he could state what special steps he proposed to take to encourage temporary reconstruction and reconditioning to improve the present position. Mr WEDDERBURN said that in view of the present pressure on the supply of building trade labour in Scotland the Secretary of State was not satisfied that a policy of temporary reconstruction and reconditioning would make any material contribution to housing needs. Following representations made to him by the Convention of Royal Burghs however he was making further inquiries on the subject.

School Medical Examinations in Glasgow—On June 15 Mr DAVIDSON asked the Secretary of State for Scotland the total number of school children medically examined in Glasgow up to the last available date, the number of medical examiners employed and the total number of children termed defective. Mr WEDDERBURN replied that the number of school children medically examined in Glasgow during the year 1935-6 at systematic routine inspection was 54,882. The medical staff comprised sixteen whole time and one part time medical officers. The number of children found to have irremediable defects was 2,359 while 44,231 had defects which were more or less readily remediable. A further 15,899 children were specially examined at the request of the parents or teachers. Most of these were found to have some defect requiring attention. There was also a re-examination of 27,005 children who had been found to have defect at previous examinations.

Hospital Staffing at Gibraltar—On June 15 Lieutenant Commander FLETCHER asked the Secretary of State for War whether the normal hospital staff at Gibraltar was too small to be able to cope with thirty-five unexpected patients or whether there were other reasons and, if so of what nature for the dispatch of four nurses to Gibraltar to nurse the wounded from the *Deutschland*. Mr HORE BELISHA replied that the staff of the Military Hospital Gibraltar was adequate to deal with a normal number of patients. The casualties from the *Deutschland* were abnormal.

Appropriation of Poor Law Institutions—Sir KINGSLEY WOOD announced on June 17 that eleven county councils and thirty-nine county borough councils in England and Wales had since the Local Government Act, 1929 appropriated Poor Law hospitals or infirmaries or parts thereof for use as general hospitals under the Public Health Acts. In addition six other county councils had appropriated such institutions for other public health purposes such as tuberculosis hospitals, maternity hospitals, convalescent homes or epileptic homes.

Notes in Brief

The number of cases of anthrax reported to the Ministry of Agriculture in March, April and May 1937 was 239 compared with 152 and 110 in the same three months of 1936 and 1935.

In Huddersfield in the years 1933-6 inclusive 1,252 children under 5 years of age were immunized against diphtheria. Of 263 cases of diphtheria recorded in the same period in children of that age group seven were in children who had been immunized.

Sir Kingsley Wood has asked the Welsh Board of Health to treat specially a request from a number of district councils in Glamorgan to discuss the administration of the Midwives Act by the county council.

Investigations into the ventilation of the House of Commons are proceeding but it is not expected that they will conclude in time to enable improvements to be made during the summer recess.

In 1936 there were three applications to the Medical Board for certificates of disablement from asbestosis, all of which were refused.

The Minister of Health does not intend to secure larger powers for local authorities to deal with nuisances caused by the emission of smoke from industrial undertakings. He has no reason to think that the powers already available are insufficient.

During 1936 5,932 persons under 16 were injured and disabled for more than three days by accidents at mines under the Coal Mines Act, 1911.

Medico-Legal

A FATALITY AFTER DIPHTHERIA IMMUNIZATION

Verdict of Coroner's Jury

The coroner's inquest¹ at Ring Co. Waterford, Irish Free State, on Siobhain Kenneally, a girl of 12 who died after an injection of T.A.F. (Burroughs Wellcome) for immunization against diphtheria was concluded on June 12. At the hearing on June 11 Dr M. O'FARRELL, the county medical officer of health, said that a specimen of the suspected fluid had been cultured and examined for acid-fast organisms and phenol. The test for phenol was positive, no acid fast organisms were found, and no organisms would grow. Several guinea pigs were inoculated with large doses, one animal died ten days afterwards, and the appearances suggested that diphtheria intoxication was at fault, but there was no evidence of tuberculosis or infection. The remaining animals lost weight, but suffered no other ill effects. No other accidents had been reported in a total of nearly 4,000 injections. He had received the bottles by parcel post.

Dr J. McGRATH was asked by counsel whether it would be possible for a suspension of living tubercle bacilli to be mistaken for T.A.F. He said that such a suspension would have to be very strong and would probably produce a relatively uniform tuberculous disease. He and other expert witnesses agreed that it was quite impossible that the bottle could have contained anything but T.A.F. or that the fluid could have been contaminated in any way. Dr P. KIELY said that the other children who had developed sores on their arms were now all well.

Dr O'Farrell's assistants gave evidence to show that the injections had been performed according to the approved technique and with every precaution. Dr MICHAEL CASEY, dispensary medical officer of Dungarvan, who had assisted Dr W. O'Donovan at the post mortem examination said that the naked-eye appearances of the lesions on the anterior surface of the liver and on the pleura were not typical of military tuberculosis of the human type but might be more typical of the bovine type.

Mr D. FAWCETT, counsel for Ring College, remarked in his address to the jury that Messrs. Burroughs Wellcome had taken the case so seriously that they had left no stone unturned to try to free themselves from blame. They had brought a professor from Dublin to their laboratories and he had given evidence that it was utterly impossible that any error could have occurred there. Mr T. C. WILLIAMS who appeared for Dr McCarthy, suggested that if the tuberculous lesions were not caused by a dirty syringe then they must have been caused by the contents of the bottle. It might be improbable that the bottle

¹ *British Medical Journal* June 5 1937 p 1182

was tampered with, but it was possible and more than possible Mr J J HORGAN for Messrs Burroughs Wellcome said that the mystery had definitely not been cleared up. No part of the batch of T.A.F. could have been contaminated during its manufacture whatever happened afterwards, because if it had hundreds of bottles would have been contaminated. The manufacturers did not sell any preparation of live tubercle bacilli and there was no question of any preparation of the bacillus getting by mistake into the bottles of T.A.F. The evidence showed that no one could have maliciously substituted a suspension of living tubercle bacilli for the T.A.F. in this bottle. Cork had formerly had one of the highest diphtheria death rates in Ireland, but owing to the campaign carried on with Burroughs Wellcome products the rate had been reduced to normal. It would be a cruel tragedy if future lives were sacrificed through any public panic.

The coroner put the following questions to the jury

(1) When and from what cause did the deceased die? (2) Was the ulcer on her arm a tuberculous ulcer? (3) If it was a tuberculous ulcer did the general tuberculous condition from which she died spread from this? (4) If it was tuberculous ulcer, did the microbes causing it enter the body at the time the child was inoculated against diphtheria? (5) If they did enter it at the time what was their source and how did they come to be injected?

Dealing with the last question he said

"The lines that would require to be investigated with any hope of reaching a solution seem to me to be almost endless. The investigation should be a long searching, and highly scientific one—an investigation that in my opinion would be more properly carried out by a body of scientists than by a coroner's jury. If you believe gentlemen that you are not in a position to give an opinion as to the origin of the tubercle bacilli you will say so and I cannot see how you are in such a position."

The jury returned the following verdict

That we the members of the coroner's jury unanimously agree with the medical testimony that Siobhain Kennelly died on April 20 1937 from toxæmia and purpuric hæmorrhage consequent to general military tuberculosis infection and that we are of opinion according to the evidence placed before us that the tuberculous condition was originated by the inoculation of prophylactic into the right arm of Siobhain Kennelly in November 1936 and that we are of the opinion that the contents of the 25 ccm bottle of prophylactic labelled T.A.F. Burroughs and Wellcome from which a portion of the material was extracted by Dr Daniel McCarthy for the purpose of the aforesaid inoculation contained tubercle bacilli and that the inoculation was carried out by Dr McCarthy according to the most approved surgical technique. Every precaution was taken by him and those associated with him to guard against infection arising from contaminated surgical appliances and we exonerate them from all blame in this matter."

FALSE PRETENCES

Phillips Abse of Cardiff was sent to penal servitude for three years at the Cardiganshire Assizes, held at Lampeter on June 14 for obtaining money on false pretences. Thomas Rees Edwards of Llanelli was sent to prison for twelve months on a joint charge. Abse's plan of campaign, apparently¹ was to call at farmhouses and send Edwards in to explain that he was going round under the national health insurance scheme, or the Lloyd George 'scheme' to test everybody's eyes and had to call at every house, he said he had a doctor outside who was an eye specialist and would examine their eyes free of charge. Abse would then be called in pretend to examine the eyes of the inhabitants and tell them that they had cataract and would be blind in a short time unless they had expensive special glasses. One witness gave evidence that he had paid ten guineas for two pairs of spectacles and another that he and his sisters had paid £20 12s for six pairs. Abse admitted twenty-five other similar offences by which he had made over £220. Edwards only got his wages as chauffeur. Mr Justice

¹ *Manchester Guardian* June 15

Greaves-Lord said that a more mean or cruel offence it was impossible to imagine. All medical men will heartily agree, and will also appreciate the effect which frauds of this kind are likely to have on the public confidence in doctors in general and health insurance practitioners in particular.

MENTAL HOSPITAL OFFICER'S APPEAL DISMISSED

In May of last year Dr H C McManus, who was formerly a medical officer at Park Prewett Mental Hospital Hampshire, brought an action against Dr R F B Bowes formerly medical superintendent, and against the visiting committee of the Hampshire Joint Mental Hospitals and their clerk. One of his grounds of action was that he had been wrongfully dismissed in being discharged summarily with three months salary in lieu of notice. When he was engaged by the visiting committee in 1923 no mention was made of the notice which ought to be given the minutes merely recorded that he had been engaged at a certain salary. Mr Justice Macnaghten, who tried the action in the King's Bench Division held that the visiting committee were protected by the Lunacy Act, 1890, s 276, which empowered them to remove any person appointed under it, meaning that they could in their discretion, at their pleasure, and without assigning any reason, revoke the appointment and remove the person from the office to which he was appointed. Dr McManus therefore lost his action and now appealed. He contended that the court would require clearer words than those of the statute to drive it to the conclusion that the committee had the right to turn out at a moment's notice a man in his position when he might be on the eve of taking his pension. Mr R P Croom-Johnson, K.C., counsel for the visiting committee, said that the Lunacy Act gave them no power to make contracts with members of the staff, but that even if the committee had made a contract with Dr McManus it was in the terms of section 276 of the Lunacy Act, and there must be read into it the power of removal. Lord Justice MacKinnon inquired under what power the committee had awarded Dr McManus even three months' salary, and whether the district auditor could have disallowed the sum and surcharged it. Mr Croom-Johnson answered that he was inclined to think so.

Giving judgement, Lord Justice Greer said that the claim was clearly barred by the operation of the Public Authorities Protection Act, 1893, s 1, which provides that a claim against a public authority must be made within six months of the cause of action arising. A claim by Dr McManus for return of contributions under the Asylum Officers Superannuation Act, 1909 s 10, also failed for the same reason. The learned Lord Justice found no evidence to justify the court in finding that Dr Bowes had knowingly and wilfully procured the dismissal of Dr McManus. Lord Justice Slesser agreed that the appeal should be dismissed, and added that the case had great importance because it went to the root of the tenure of every person employed under the Lunacy Act. He expressed the opinion that the committee had power under that Act to remove any of its servants at will.

The result of this unfortunate action is to confirm the fairly obvious interpretation of the employment section of the Lunacy Act, but it may remind present and prospective mental hospital officers of the precarious tenure under which they hold their appointments. It is even probable, as Mr Croom-Johnson pointed out, that if a visiting committee employed a medical man on a definite written contract by which they undertook to give him six months' notice of termination the words of the section would make that undertaking completely valueless. Fortunately, like many similar provisions this section of the Act is not as onerous in practice as in theory.

Obituary

SIR SQUIRE SPRIGGE, M.A., M.D.,

FRCP FRCS F.A.C.S

Editor of the *Lancet* 1909-1937

We have to record with deep regret the death on June 17, after a short illness of Sir Squire Sprigge, the Editor of the *Lancet*. He had upheld the traditions of our contemporary for forty five years, and was recognized at home and abroad as a great medical journalist, whose service to the profession and to the public cannot be measured in words. His personal influence on the world of medicine quietly wielded in the background, owed much to the wide range of his interests and the many social contacts he made in other walks of life.

Samuel Squire Sprigge, eldest son of a country doctor in Norfolk, was born at Watton on June 22, 1860. He went to Uppingham School under Edward Thring and was one of the many boys whom that indomitable head master took to temporary quarters at Borth on the Cardigan coast during the typhoid outbreak at Uppingham which threatened to ruin the school in 1875. On his father's death he left school for Gonville and Caius College Cambridge, spending three active and happy years there and passing on to St George's Hospital where he made more friends. He took the M.R.C.S. diploma in 1886 the Cambridge M.B. and B.Ch. degrees in 1887 and proceeded M.A. and M.D. in 1904.

With a natural gift of clear expression a taste for the company of writers and artists and no liking for humdrum medical practice Sprigge occupied as much time as he could spare in literary pursuits making ends meet by work as private secretary to Sir John Russell Reynolds a leading London physician and as secretary to the newly founded Society of Authors of which he was afterwards chairman. In those early years he formed many interesting and valuable friendships at the United University and Savile Clubs and went with Sir Walter Besant on a

lecturing tour in America. Then, at the end of 1892 came an offer to join the *Lancet* and acceptance of this invitation proved to be the turning point of his career. He had not been with them long when the Editors, T. H. Wakley, F.R.C.S., and Thomas Wakley, L.R.C.P., son and grandson of the founder, gave Sprigge the congenial office task of tracing the origin and early fortunes of the paper and the tempestuous story of its founder. This excellent piece of literary and historical work came out in serial form in the *Lancet* and afterwards as a book *The Life and Times of Thomas Wakley*. It is a mine of information about the medical world of London its quarrels and

abuses, during the first half of the nineteenth century.

When Sprigge entered the *Lancet* office he made the acquaintance of four stalwart friends of the paper who acted as part time editorial advisers: Sir John Tweedy, Dr Sidney Coupland, Dr James Grey Glover and Surgeon-General Jeffery Marston and at the centenary dinner in 1923 he paid tribute to them and to his indoor colleagues Dr H. P. Cholmeley, and Mr S. Archibald Vasey who directed the chemical laboratory for many years. He spoke of himself on that occasion as a friend-made man. In 1905 a series of anonymous articles from his pen were accepted as a Cambridge M.D. thesis by the Regius Professor of Physics, and reappeared in book form under the title *Medicine and the Public*.

In 1907 the year of a costly libel action T. H. Wakley died, and his son, now nominally sole Editor came to rely more and more on Sprigge for the conduct of the journal. Thomas Wakley the third died in March, 1909 and with the end of the dynasty Squire Sprigge became Editor in name as well as in fact. The ownership of the *Lancet* passed into the hands of a private company and after a few years Messrs Hodder and Stoughton acquired the controlling interest. For a time during the early part of the war Sprigge ran the journal almost single handed, but nevertheless found time to organize and administer, with Dr H. A. Des Voeux, the Belgian Doctors and Pharmacists Relief Fund and for this charitable work, which brought in more than £25,000 he was awarded the *Medaille du Roi Albert* by the King of the Belgians. In January 1921 he received the honour of knighthood in

company with his friend Dawson Williams, Editor of the *British Medical Journal* and was elected F.R.C.S.Eng., followed six years later by election to the Fellowship of the Royal College of Physicians of London. In the latter part of 1928 he revisited the United States and Canada, and gave the annual Hunterian Lecture to the American College of Surgeons and was elected a Fellow of that body. A signed report of his tour and on medical education in North America was published as a special supplement to the *Lancet*. His book *Some Considerations of Medical Education* had appeared in 1910 and in 1920 he served as vice president of the Section of Medical Education at the Annual Meeting of the British Medical Association in Cambridge. In 1921 he published a volume of essays entitled *Physic and Fiction*. His unsigned contributions to the paper for which he lived, if they were collected from the files of forty-five years would occupy a row of volumes on the office shelf.

Squire Sprigge married in 1895 Beatrice, daughter of the late Sir Charles Moss, Chief Justice of Ontario. She died in 1903, leaving two children, a son, Cecil Sprigge now financial editor of the *Manchester Guardian* and a daughter Elizabeth (Mrs Mark Napier) the novelist. In 1905 he married his first wife's cousin, Ethel Coursolles, daughter of the late Major Charles Jones, the gunnery expert. Lady Sprigge survives him with a daughter, Annabel, who lately held an exhibition in London of her drawings and sculpture.

A Personal Appreciation

Squire Sprigge was a man of exceptional ability and force of character. His mind had been trained in the discipline of the classics under a great head master; its edge was sharpened by the study of science at Cambridge, and made sharper by the study of mankind at St. George's. The practice of medicine had no appeal for him, what he liked was the battle of life, the contest of mind with mind. He was widely read without bookishness, witty of speech, incisive of pen when the mood took him, and dexterous to a high degree in the handling of men and situations, the more difficult the tangle or the tougher the problem, the more he enjoyed finding a way through or round it. When on his mettle—and until the last few years he was always ready for anything or anybody—Sprigge could hold his own against a keen academic brain or in combat with hard business wits.

Two early experiences were of much value to him in the rough and tumble of weekly medical journalism. One was the post of confidential secretary to the Victorian physician Sir John Russell Reynolds; the other was the secretaryship of the Society of Authors under his club friend Sir Walter Besant. It was not long after joining the staff of the *Lancet* in 1892 that Sprigge began to be recognized, by those who knew the personalities at 423, Strand as the master spirit in the editorial office. But the Wakleys, who owned the paper in succession as a family affair, were grudging of titles and Sprigge remained a subeditor for sixteen years until his inevitable promotion to the editorship on the death of the third Thomas Wakley in 1909. Meanwhile he had written an admirable biography of the founder of the *Lancet* had expanded his own M.D. thesis into a book *Medicine and the Public* had produced some short stories and miscellaneous papers and a small prickly work on methods of publishing. His novel *An Industrious Chevalier* anticipated the first of the "Raffles" stories by E. W. Hornung but made no popular hit, largely by reason of a lack of sentimentality—or, as some would say, a cool objectiveness—in style

and approach. These imaginary episodes, reprinted in 1909 and 1930, make an entertaining book, and the careful reader can find in them some clues to the author's own personality.

His first ten years as Editor were uphill all the way. Old members of the staff dropped out, new colleagues came and went, the proprietorship of the paper changed hands twice, the National Insurance Bill crisis was followed by the anxious and difficult period of the war. Through this and through the time of reconstruction Sprigge kept the *Lancet* on its course. Only those who have been behind the scenes in a small newspaper office can have any idea of the burden borne day in and day out by the man in charge under such conditions. From 1919 onwards the Editor's task lightened, and of late years he took life more easily.

By nature clear-cut and by habit undemonstrative, Squire Sprigge had no use for sloppiness or gush. But he felt and inspired real affection, and thought much about his friends and helped them with both hands when need arose. Wit and humour do not always go together. "S S S" had both, and a keen appreciation of them in other people. He was a most stimulating and delightful companion, at work or at play, a wise counsellor, a loyal son of his school, his college, and his hospital, and above all things faithful to the great journal which he served for forty-five years.

One more thing should perhaps be said here. The thirty years' war between Ernest Hart and the Wakley family, which poisoned the relations between *British Medical Journal* and *Lancet* was abhorrent to urbane and magnanimous men like Dawson Williams and Squire Sprigge. Hart's death gave them the opportunity to make open peace and establish private good will at each corner of the old block of houses in the Strand. Forty years have passed and the two journals now live further away in new homes. The healthy rivalry goes on, but there has been no break in the cordial relationship begun by Williams and Sprigge and continued by their fellow workers.

Tribute by Lord Dawson

A memorial service was held in the Church of St Martin-in-the-Fields on June 22, and was attended by a large congregation representative of the many sides of Sir Squire Sprigge's public and private life. Viscount Dawson of Penn, President of the Royal College of Physicians, gave the following brief address from the pulpit.

At this service of remembrance I will try and give expression to our admiration and thankfulness for the life of Squire Sprigge.

The son of a doctor, he belonged to the Norfolk countryside and there his spirit lived during life and his body now rests. His life was long, rich and varied in achievement, clear and staunch in its purpose. Coming from Uppingham, Carus College, and St George's Hospital his career was from the first that of author and journalist in varied fields to which he brought scholarship, competence, and a lively sense of the problems of his day and generation. The *Lancet*—this was the chief sphere of his work and influence. His association with that great journal began when he was aged thirty-four and he was editor, by succession from the distinguished Wakley family, for the last thirty years of his life and picture those thirty years—the rising tide of new knowledge, the growing concern of Medicine for the health and weal of the people, the uprise of medical insurance and com-

munal services—these and other changes surged round us in the hurry of the times. From Sprigge in his weekly chronicle came the still small voice of reason, which went far to save our profession from the mere clamour of the passing show. Let me bear witness to the service rendered not only to medical science but to national well-being by those friendly rivals, the *Lancet* and the *British Medical Journal* who both regard power as a trust for the public good. Together they embody the expression of the compass, the expanding sphere and the dignity of English medicine of which the last two generations have been the witness.

With the passing of the years Sprigge's influence radiated far and wide. His culture and urbanity, his liberal outlook and quick appreciation, his enterprise of thought and youthfulness of spirit and his apt choice of word and phrase made welcome his counsel and companionship. That his life was many-sided is shown by his devotion to sport in his youth and in later life his enthusiasm as a painter in water colour and his love of gardens. For him beauty was truth and truth beauty. He was a leader by the force of example, the power to persuade and encourage others and make his workers feel themselves to be friends engaged in a common enterprise and his kindness had a sureness of touch which brought all men to him. And yet he was a shy man who sought the shadows, forgetful of self though never forgetful of others. Without sense of mission his message was part of himself for a man's soul is sometime wont to bring him tidings, more than seven watchmen that sit on high on a watch tower. All through he made truth and the counsel of his heart to stand. His work done, we say farewell and hold fast to a memory—proud, grateful and long abiding.

F W COLLINSON MD FRCSEd

Dr Frederick William Collinson as recorded in last week's *Journal* died in his eighty-fourth year at his home in Preston on June 9. His whole life, from the time he first commenced private practice in 1889 until his death was passed in the same house. He was the second of three sons of Thomas Collinson, the headmaster of Duke's School, Alnwick, an institution built by a Duke of Northumberland in celebration of George III's Jubilee. A brother likewise came to Preston, and was for thirty-seven years the well-known and popular Vicar of Broughton, only two miles from Preston. A half brother was organist at St Mary's Cathedral, Edinburgh for fifty years.

In 1887 he came to Preston as resident house surgeon at the Preston Royal Infirmary. His association with that institution was continued throughout his professional life and proved an influence of tremendous value on the work and prestige of the hospital. He remained as senior resident house surgeon from 1887 to 1889 and then commenced private practice at the house—32, Winckley Square—which he occupied up to his death. At first he began in general practice, but could not bring himself to the usual dispensing practice, and from the first determined that he would prescribe only for his patients. Much pressure was brought to bear on him by some of his older colleagues who told him that he could never hope to succeed on those lines. When he found at the end of his first year's work that his total earnings were £78 he had serious misgivings, nevertheless he stuck to his guns. From the first he set out to do his work as thoroughly as he knew how. He was most

meticulous not only in the examination of his patients but in painstaking and accurate recording and preservation of notes, so that though in general practice, he was able at once to look out from his files the records of any patient for many years back. His reputation rapidly spread, and soon he attained a prestige for thorough careful work throughout a radius of many miles, and this gradually extended throughout the county during the years. In the first year of his practice he was elected as an honorary medical officer to the Preston Infirmary. Later, when the staff was divided into physicians and surgeons, as his main interest was in surgery he became an honorary surgeon. He was

absorbed in his work and took every opportunity of visiting the operating theatres in the hospitals of the great cities and watching the well-known surgeons of his time. At the dawn of the aseptic period he was laughed at by his older colleagues for the introduction of his rubber gloves, his white sterilized gown, his white shoes, and complete change of clothes. His reply to one was:

'Surely it is as important to change one's clothes for a serious operation as for a game of tennis. With the late Sir Charles Brown he visited many hospitals and threw himself with enthusiasm into the planning and erecting of the new operating theatre which Sir Charles Brown presented to the Preston Infirmary about 1900. He gave up any private practice about 1909 and then devoted himself to consulting work. By this time Collinson's reputation had spread far and wide and many were the operations he performed in private houses at long distances before the day of the private nursing home in the provincial town or the private wards in a hospital. He designed a portable operating table with its own portable electric lighting supply, and the people of Preston were familiar with his car carrying the case for the operating table. He contributed several articles to the journals, one of which described the successful excision of a tremendous gall-bladder of three gallon capacity (*BMJ* 1909). During the war he did much valuable work at the Preston V.A.D. Hospital as well as at the Royal Infirmary.

He retired from the staff of the Preston Royal Infirmary in 1923. Shortly afterwards he was presented by his colleagues of the Preston Medical Society with his portrait in oils by Mr W W Russell A.R.A. This portrait he gave to the Preston Royal Infirmary, and it now hangs in the library there. Ever of active mind and habits, he was elected to the local Town Council and served from 1924 to 1934 as a councillor, and was made an alderman in 1934 but retired from public life in 1935. He was president of the Lancashire and Cheshire Branch of the British Medical Association in 1929 and had been local secretary for the Epsom College Foundation for over thirty-six years. He married late in life at the age of 49 but the union only lasted eight years for his wife died in 1910.

His interests were always serious. He was interested in history and archaeology and later in paintings and the Art Gallery and was instrumental in improvements

in the noble Harris Library and Museum in Preston. He had little or no concern with sport. By nature he was of quiet, retiring, and apparently somewhat austere disposition, but those who knew him well soon found that there was no austerity. Many junior colleagues have gone to his house with their professional and private troubles and sat in his consulting-room at night asking his advice on multifarious subjects. They always found him kind and gentle, and helpful. He was rigid in the standard of conduct which he practised himself and demanded from others, whether from his House men or from his friends. He was a deeply religious man, though never flaunted it before others. It is said that he always prayed, quietly to himself, for a few moments before going into his operating theatre. He was a man of quite exceptional dignity of speech, behaviour, and appearance, and yet kindly, gentle, and even affectionate. He was held in the highest regard by all his medical colleagues, and by all classes of the general public in and around the town of his adoption. It is safe to say that his passing leaves a gap which no one man is likely to fill in the future.

A. E. R.

ROBERT CARSWELL, M.A., M.B., CH B

Wandsworth

-With the passing of Dr Robert Carswell, which took place on June 16 after an operation for acute appendicitis, the Wandsworth Division of the British Medical Association loses one of its stalwarts, a man of strong views, and intense enthusiasm for any object that he felt compelled his support.

Robert Carswell was born in Glasgow in 1871, and graduated M.A., M.B., Ch B in the university of that city. After holding various hospital appointments at Colchester, Huddersfield and Liverpool, and serving as a civil surgeon in the South African War, he settled in practice in Wandsworth. In the great war he served as medical officer to the R.F.A. His was a forceful personality and his tall, well built figure was sure to be found, vigorously expressing his opinions on medical politics at most meetings of the Division. He threw himself with great vigour into the controversy which preceded the passing of the National Health Insurance Act, of which he was a strong opponent to the end. He was genuinely honest in his opinions, which he held and defended with great tenacity. This characterized his efforts to secure what in his opinion was the method of use of tuberculin. He was a true disciple of Koch, and always felt that the treatment of tuberculous disease, as laid down by Koch, was not properly carried out in this country, and this neglect was in his opinion responsible for the poor results obtained. He collected a large quantity of evidence in support of his opinion, and kept careful details of all cases that he himself treated with tuberculin. He devoted a large part of his life in the pursuit of this study, and it seems tragic that the mass of material collected by him should be wasted. He described a number of his cases in the *British Medical Journal* and whenever the question of tuberculin treatment appeared in print throwing any doubt on the method a vigorous letter would almost surely follow from his pen.

Dr Carswell had been president of the South West London Medical Society and his colleagues in this society and the British Medical Association will miss the presence of one who was not only a great gentleman but also both a stimulus and an inspiration.

T H G

The death of Professor AUGUST WIMMER on May 20 from malignant disease of the lungs robs Denmark of her most distinguished psychiatrist and neurologist. He was born on February 26, 1872, at Odense, and quite early in his career he began his psychiatric studies in a Danish mental hospital. In 1912 he was put in charge of the large mental hospital, St. Hans, and in 1919 he was appointed professor of psychiatry and neurology, in succession to Professor Friedenreich. Many of his post-graduate studies were conducted in France, and he was a welcome visitor in England and the U.S.A. He published 125 scientific books and articles, several of which were translated from the Danish into other languages. His book on psychiatric neurological methods of examination was published in 1918 in English, and his two large works on epidemic encephalitis appeared in the same language. He was a familiar figure at international congresses, and he enjoyed a well-founded reputation for an encyclopaedic knowledge of his specialties. His attitude towards psycho-analysis remained reserved till the end, and he was a personality one might like or dislike, but not ignore. The best of him came out in his contact with children, to the rest of the world he was apt to be an enigma even when in a sociable mood.

The Services

OSBORNE CONVALESCENT HOME

The King has approved the appointments of Sir Cuthbert Wallace Bt., KCMG CB., Mr W Rowley Bristow Mr Claude H. S. Frankau CBE, DSO, Professor J Paterson Ross, Mr G T Mullally, Professor F R. Fraser Dr Gordon M. Holmes CMG., CBE. FRS, and Dr Geoffrey Marshall, OBE., to the civil consulting staff of King Edward VII's Convalescent Home for Officers at Osborne Isle of Wight.

I M S ANNUAL DINNER

The thirty sixth annual dinner of the Indian Medical Service took place in London at the Trocadero Restaurant on June 16 with Brevet Colonel Sir Rickard Christophers FRS in the chair. The official guests at the high table were Sir Frank Brown of the *Times* Dr N G Horner Editor of the *British Medical Journal* Major-General W P MacArthur AMS Sir Frederick Menzies Dr E. C. Morland of the *Lancet* Dr H Letheby Tidy, and Professor G Grey Turner. After the health of the King Emperor had been honoured the chairman proposed the toast of "The Service" and welcomed all the guests including the newly joined officers. The history of the I.M.S. Colonel Christophers said was a long and in a medical sense glorious one and they were glad to have present with them again that night their historian Colonel Crawford. The activities of the Service were no less important and varied now than in former times. Many past officers were holding high positions while the serving officers of to-day upheld the tradition in India. Lieut.-Colonel Sinton VC., proposing the chairman's health said that the name of Rickard Christophers had been bound up with work in malaria for forty years. In the great epidemic of 1908 the teaching of the officers fell upon him and the I.M.S. had never had due credit for the pioneer work then done. Sir Rickard's researches from first to last were always directed to the basic principles of malariology and vital statistics his models of mosquitos revealed him as the man of science who was also an artist.

The public proceedings ended with some stories told by Colonel Anderson at the chairman's request, and an acknowledgement to the honorary secretaries of the dinner Sir Thomas Carey-Evans and Sir Richard Needham. The officers present at the dinner were

Major-Generals W V Coppinger A W M Harvey Sir Courtenay Mansfield Sir John Megaw C W F Melville Sir Leonard Rogers Sir Cuthbert Spradon G Tate

DEATHS IN THE SERVICES

Major FRANCIS ALBERT SAW R.A.M.C. (retired) died at Oxford on March 24 aged 75. He was born at Greenwich on January 7 1862 educated at Newcastle, and graduated as M.B.Dunelm in 1885 subsequently taking the D.P.H. of the London Colleges in 1902. Entering the Army as surgeon on January 30 1886 he became major after twelve years service, and retired on June 20 1906. He served in the operations in South Africa in 1896 receiving the medal and in the South African War from 1899 to 1901 taking part in the operations in Cape Colony and gaining the Queen's medal with two clasps

Universities and Colleges

UNIVERSITY OF CAMBRIDGE

During the month of May the following titles of medical degrees were conferred by diploma on members of Newnham College

M.B.B.Chir.—J C Drury

M.B.—M E Barnard D M Norman Jones Mrs O K Wilson

The following medical degrees were conferred at a congregation held on June 19

M.D.—J G C Spencer

M.Chir.—J W S H Lindahl

M.B.B.Chir.—W E Joseph J R Dickinson, J R Harris

M.B.—J W S H Lindahl *D Divine, A T Howell T D F Money H P R Smith

* By proxy

UNIVERSITY OF LONDON

The following have been recognized as teachers of the University in the subjects indicated in parentheses

St Bartholomew's Hospital Medical College Dr A. H T Robb Smith (Pathology)

London Hospital Medical College Mr E C B Butler and Mr A. Tudor Edwards (Surgery)

Guy's Hospital Medical School Mr R J Cann (Oto-rhinology) Mr F W Law (Ophthalmology)

St Mary's Hospital Medical School Mr H C Gage (Radiology) Mr G Roche Lynch (Forensic Medicine)

Westminster Hospital Medical School Dr H T Barron (Dermatology)

University College Hospital Medical School Dr J C Hawksley (Medicine) Dr R S Picher (Surgery)

King's College Hospital Medical School Mr E B Clayton (Physical Medicine)

London School of Hygiene and Tropical Medicine Dr T Bedford (Hygiene and Public Health)

Royal Dental Hospital of London and School of Dental Surgery Mr S Blackman (Radiology)

British Post Graduate Medical School Dr Janet M Vaughan (Pathology)

Dr A M H Gray has been elected chairman of the Graham Legacy Committee for the year 1936-7 and Professor C R Harington F.R.S., has been appointed Director of Research under the Charles Graham Medical Research Scheme for a period of one year from October 1

The following appointments have been made Dr A M H. Gray and Mr W Girling Ball as governors of the British Post Graduate Medical School Professor W W Jameson as representative of the University at the eighth Imperial Social Hygiene Congress London July 5 to 9 and Dr R A Young as representative of the University at the twenty third Annual Conference of the National Association for the Prevention of Tuberculosis, Bristol, July 1 to 3

MIDDLESEX HOSPITAL MEDICAL SCHOOL

The annual prize giving ceremony of the Middlesex Hospital Medical School will be held at the Scala Theatre Charlotte Street W on Wednesday July 21 at 3 p.m. when the Prizes and Medals for 1936-7 will be presented by Viscount Dawson of Penn and the Introductory Address will be delivered by Dr G E. Beaumont

The refresher course for old students of the Medical School will begin on Friday October 1 at 2.15 p.m. and will terminate on Sunday afternoon October 3. A detailed programme will be circulated about four weeks before the course starts

The annual dinner of the Medical School will be held at the Savoy Hotel on Friday October 1, with Dr Douglas McAlpine in the chair

UNIVERSITY OF BRISTOL

The following candidates have been approved at the examination indicated

FINAL M.B. CH.B.—Section II P B Ryan (with second-class honours) Daphne V Dennis J P M Forde C R G Howard H James, A D Jones N R Matheson A N H Peach (with distinction in surgery) J W E Snaadon A M Spencer R Tallack P Zimmering

UNIVERSITY OF MANCHESTER

At the meeting of the Court of Governors on June 2 a proposal to confer the honorary degree of Master of Arts on Dr E Bosdin Leech was accepted. The proposer and seconder mentioned Dr Leech's long connexion with the Medical School his great services as honorary librarian of the medical library and his work in archaeology

The Wild Prize in Pharmacology has been awarded to J M Rowson, and the Anaesthetic Prize in Dentistry to R. H Darden

The following candidates have satisfied the examiners at the examination indicated

M.D.—*B. Thesis* A. Bigham *A. J E Cave *L Fay H A. Palmer *H J Wade

* With commendation

UNIVERSITY OF GLASGOW

The following degrees were conferred at a ceremony of graduation held on June 16

Hon LL.D.—John M Cowan M.D. Physician to the King in Scotland, the Right Hon. Walter Elliot P.C. M.B. Secretary of State for Scotland Thos Kirkpatrick Monro M.D., Emeritus Professor of Medicine in the University of Glasgow Sir Robert Muir M.D. F.R.C.P. Ed. F.R.S., Emeritus Professor of Pathology in the University of Glasgow Ralph Stockman M.D. F.R.C.P. Ed. Emeritus Professor of Materia Medica in the University of Glasgow

M.D.—D P Cuthbertson (with honours) I K. Buchanan (with commendation) Agnes T Kennie G Pollock T M Sharp

Ch.M.—W J L Fraocis

UNIVERSITY OF WALES

WELSH NATIONAL SCHOOL OF MEDICINE

The following candidates for the degrees of M.B. B.Ch. have satisfied the examiners in the subject indicated

Medical News

The Right Hon Christopher Addison M.D., who was raised to the peerage in the Coronation Honours List has taken the title Lord Addison of Stallingborough, in the County of Lincoln

Sir Farquhar Buzzard, President of the British Medical Association, will open the new Central Clinic at Bristol on Friday July 9. This clinic, erected at a cost of £47,000, will provide maternity and child welfare services, school medical services, dental and tuberculosis treatment facilities, and a dispensary

The annual dinner of the Cambridge Graduates Medical Club will be held at Corpus Christi College, Cambridge, on Friday, July 2, at 7 for 7.30 p.m., with the president elect Sir Walter Langdon-Brown, in the chair. The honorary secretaries are Mr W D Doherty 10 Upper Wimpole Street, W.1, and Dr L E H Whitty

Sir Kingsley Wood, Minister of Health, will distribute the prizes at the London Hospital Medical College on Tuesday July 6 at 3 p.m.

A discussion on the training of nurses over seas and for over seas service will be held under the auspices of the Imperial Social Hygiene Congress at Caxton Hall, Westminster, on Wednesday July 7, at 10.30 a.m. Those who are interested should apply for tickets of admission to the secretary Imperial Social Hygiene Congress, Carteret House Carteret Street, S.W.1

A meeting of ophthalmic surgeons and ophthalmic medical practitioners will be held at 17 Russell Square London W.C.1 on Saturday July 3 at 3 p.m. with the object of constituting a group to protect their status and interests especially in relation to unqualified prescribing and non prescribing opticians, and to be organized within or with the approval of the British Medical Association

The forty first Congress of French-Speaking Alienists and Neurologists will be held at Nancy from June 30 to July 5 when the following subjects will be discussed biological study of acute alcoholic delirium cerebellar atrophy and neuro psychiatric regulations in the engagement of recruits. Further information can be obtained from Professor Combemale, Routé d'Ypres, Baillieu

The second International Congress of Mental Hygiene will be held in Paris from July 19 to 24, under the presidency of Dr E. Toulouse

The International Congress for the Protection of Childhood will be held in Paris from July 19 to 21, with M. Albert Lebrun President of the Republic, as president of honour. Further information can be obtained from 67, Avenue de la Toison d'Or, Brussels

The third International Medical Congress to be held in Switzerland will take place at Interlaken from August 29 to September 4. One day will also be spent at Berne under the auspices of the medical faculty of the University. The subscription is ten Swiss francs. Further information can be obtained from the *Schweizerische medizinische Wochenschrift* Klostenberg 27, Basel

On the occasion of the celebration of the foundation of the University of Athens the following among others, were elected honorary doctors. Sir Charles Sherrington, Professors O Naegeli of Zurich, von Koranyi of Budapest, L. Aschoff of Freiburg, Augustus Bier of Berlin, R. Krehl of Heidelberg, Hymans van den Bergh of Utrecht, and J. Wagner von Jauregg of Vienna

An interesting collection of varied goods, gifts from thirty six countries, is now passing through the British Customs in preparation for the British Red Cross Society's international bazaar which is to be held at the Central Hall Westminster S.W.1, on July 7 and 8. The bazaar is in aid of the Florence Nightingale International Foundation, which has its headquarters in London, and which constitutes a permanent memorial to Florence Nightingale in the form of an endowed trust for post-graduate scholarships providing advanced courses of nursing at Bedford College. The special training given by the foundation includes courses dealing with public health administration and teaching in schools of nursing, and social work, for women who have had the best nursing training available in their own countries

The 250th anniversary of the German Academy of Medicine, of which Professor H. Abderhalden is president, was celebrated at Halle on May 28

Letters, Notes, and Answers

All communications in regard to editorial business should be addressed to THE EDITOR BRITISH MEDICAL JOURNAL B.M.A. HOUSE TAVISTOCK SQUARE W.C.1

ORIGINAL ARTICLES and LETTERS forwarded for publication are understood to be offered to the *British Medical Journal* alone unless the contrary be stated. Correspondents who wish notice to be taken of their communications should authenticate them with their names not necessarily for publication

Authors desiring REPRINTS of their articles published in the *British Medical Journal* must communicate with the Financial Secretary and Business Manager British Medical Association House Tavistock Square W.C.1 on receipt of proofs. Authors over seas should indicate on MSS if reprints are required as proofs are not sent abroad

All communications with reference to ADVERTISEMENTS as well as orders for copies of the *Journal* should be addressed to the Financial Secretary and Business Manager

QUERIES AND ANSWERS

Alcoholic Poisoning

"PERPLEXED No. 2" writes I have a friend who is given to severe attacks of intemperance during which he suffers from acute alcoholic poisoning. The attacks usually last for about a week and there are often quite long periods of abstinence. I wonder if any of your readers could tell

me of a cure which could be given without the patient's knowledge and which would not necessitate institutional treatment?

Colourless Iodine

Colonel R J BLACKHAM (London EC4) in reply to Dr J Jackson (*Journal* May 29 p 1144) writes. The tincture of iodine decolorata of the BPC is prepared by dissolving iodine in 90 per cent alcohol and then adding a strong solution of ammonia. The mixture is kept in a warm place until it becomes colourless. The German method of making the preparation consists in dissolving ten parts of iodine and fifteen parts of a 10 per cent solution of water and then the mixture is well shaken and seventy five parts of 90 per cent alcohol is added. The preparation is kept for three days in a cool place and then filtered. It is therefore clear that these compounds are not preparations of the halogen but are ammoniacal alcoholic solutions containing ammonium iodide and ammonium iodate and consequently possess very little therapeutic value. In order to avoid staining in the treatment of rheumatic and pulmonary affections only preparations such as unguentum iodi intinctum (Martindale) or iodox should be used.

Rheumatism and Tuberculosis in General Practice

Dr H V MITCHELL (Bournemouth) writes. I have read with much interest Dr Bunting's letter in the *Journal* of May 15 (p 1056). Having used Warren Crowe's vaccines in the treatment of rheumatic infections for several years I should like to confirm what Dr Bunting says as to their general usefulness and the satisfactory results obtained by means of the small doses. One thing that has interested me particularly has been that by far the greatest number of patients that were having or had had this treatment did not contract influenza during the recent epidemic although many were exposed to the infection in their own homes. This point is one of interest when so much work is being done to find a successful vaccine for influenza although it may only be a coincidence. Dr Warren Crowe to whom I wrote asking for his opinion replied. It is a very common finding that patients under vaccine treatment do not get either severe colds or influenza to anything like the normal extent. The probable answer is that many cases are complicated by streptococcal infection and this is prevented by the vaccine. It would be interesting to hear if others who use the vaccine have noticed in their cases results similar to the above.

Income Tax

Earned Income Relief—Secrecy of Returns

Advice explains that he is a partner in a firm and out of his share of the profits pays interest some under deduction of tax (£50) and some to a bank in full—£60. Why should this fact reduce the relief on his earned income? The inspector of taxes has given the firm's agents particulars of his allowances, in spite of the fact that he had asked for such matters to be referred to himself only.

.. That portion of the earnings which is paid away in the form of interest is regarded for purposes of relief as the (unearned) income of the lender and not as part of the borrower's own income. So far as ordinary interest is concerned the point was raised in the case of Adams v. Musker in which it was decided that Section 17 of the Income Tax Act 1918 applies to earned income. That section provides that a claimant shall not be entitled to relief in respect of any income the tax on which he is entitled to charge against any other person or which he is out of any payment which he is liable to make to any other person. While this provision does not directly cover bank interest it is thought that the courts would probably apply it by analogy. Tax is paid at standard rate on £90 but as tax on £50 is recoverable by deduction from the lender it is only on £40 that tax can be repaid at the full rate. The difficulty with regard to the secrecy of the allowances arises from the fact that partnership profits are assessed on the firm and not on the individual partners and consequently the formal notice of assessment must show the aggregate of the allowances claimed by all the partners. The reference of that notice to the accountants by the senior partner of the firm was doubtless necessary to enable the net duty to be correctly apportioned between the partners.

Removal Expenses

W R removed voluntarily to new premises, but continued to use the old premises for professional purposes only until a surgery was built at the new address. The inspector of taxes has disallowed £4 the cost of removing surgery fittings etc., and one third of the Schedule A assessment on the old premises up to the date they were completely vacated.

.. The disallowance of the cost of removal is justified by a legal decision (Kitton v. The Aberdeen Granite Company) but seems a little harsh as presumably wear and tear allowance is not claimed on the fittings. If it is so claimed the £4 can be added to the capital value for future allowances. As regards the Schedule A assessment we know of no justification for adding the one third for any period after residential use of the premises had ceased and we should have thought that would have been admitted immediately the facts were made clear to the inspector.

LETTERS, NOTES, ETC

Posture

Dr JOSIAH OLDFIELD writes from Kingston Jamaica. The evil effects of spinal malformation need not nowadays be stressed. The progressive kyphosis—so commonly looked upon as a necessary senile stoop—is not only aesthetically repellent but is physiologically injurious. We are to-day talking a great deal about replacing the C3 by the A1 in our race but while gymnastic exercises and physical drills are excellent there is at present no definite aim at securing a graceful and erect posture as a permanent human carriage up to extreme old age. Yet the Greeks attained it two thousand years ago and to-day in Jamaica I find such training in graceful carriage and erectness of spinal position that it is a pleasure to look at children and adults, at old men and aged women striding along mile after mile with easy step and swinging limbs and head erect. In Greeks and Jamaicans the secret of this physiological balance is to be found in the amphora and the basket always carried on the head. If in every school the pupils had a daily half hour's drill in walking freely and easily with a tumbler of water on the head we should develop a permanent habit of posture which would oust the present shambling gait and round-shouldered stoop.

Short-wave Therapy

Dr H J TAYLOR of the St John Clinic writes. My attention has recently been drawn to a letter by Dr P P Dalton (May 29 p 1144) in reply to one which I sent to you. My letter was not intended to be a counterblast to any work which Dr P P Dalton has done but as a simple statement which should be of interest to all who have any concern in short wave therapy. With regard to the new evidence which Dr Dalton is supposed to have produced Sir Leonard Hill and myself will have something to say later, but I would draw Dr Dalton's attention to previous literature on the subject (noted) very similar claims to those put forward as new evidence by Dr Dalton. J Audial in 1932 and N Delherm and H Fischgold in 1934 made exactly similar claims as Dr Dalton's (1937). I fail to see therefore that any new evidence has arisen.

Corrigenda

Our note on Dr Donald Hunter's lectures on Occupational Diseases (June 5 p 1161) said that these had appeared as clinical supplements to the *Guy's Hospital Gazette*. We should have printed *London Hospital Gazette*.

In Dr Gardiner Hill's paper published in last week's *Journal* there is an error in the eighth line of the second paragraph under the heading "Differential Growth" on page 1241. Counts of fourteen to twelve cells are common should read Counts of fourteen to twenty cells are common.

In Dr Ralph Worrall's letter on a new treatment for chronic leucorrhoea which appeared on April 10 at page 781 we gave his prescription incorrectly. The amount of nitrate of silver should have been 16 grains not 1/16. The prescription should read

R Argent nit
Aqua dest
Spirit aetheris nitrosi
Fiat applic

Sg Shake the bottle

EPITOME OF CURRENT MEDICAL LITERATURE

Medicine

503 Acute Diffuse Glomerulonephritis

ST LITZER and P HEILMANN (*Med Klinik* May 7, 1937, p 630) point out that acute diffuse glomerulonephritis is not an uncommon cause of sudden death. They report nine fatal cases which have been under their care in the past year, the patients' ages varied between 6 months and 35 years. In no case was an accurate diagnosis made before admission. In four cases meningitis was suggested, in one neurosyphilis, in one encephalitis, in one gastro-enteritis, in one gas poisoning, and in one accident. In eight cases the predominant picture was that of sudden coma with clonic spasm occurring during apparent health. In four cases in which the urine was examined no albumin was found in one and only a trace of it in the others. In five cases in which the blood pressure was taken it was normal in one and raised in four. The blood urea varied between 21 and 110 mg per 100 ccm of blood. Neither indican nor xanthoprotein were retained. Blood-letting and lumbar puncture, although done early, did not prevent death. Oedema of the brain was found at post-mortem in four cases, in five it was absent. In two of the latter cases perivascular and capillary haemorrhages were present. In two cases no anatomical changes were found in the brain. In five cases macroscopic examination of the kidneys was negative. Microscopical examination revealed acute diffuse glomerulonephritis in all cases.

504 Vitamin C Diuresis

M A ABBASY (*Biochem J* February 1937, p 339) reports a specific diuretic effect of vitamin C on human beings. The urinary volume and urinary output of ascorbic acid in children on a constant diet and fluid intake, of whom ten were active rheumatics, ten convalescent rheumatics, and ten controls, were measured before and during the administration of 5 mg of ascorbic acid a day for each pound of body weight. In all these cases increased output of ascorbic acid and of urine occurred at once in the controls and after two days in the rheumatic cases. In five other controls, maintained under similar conditions but not given ascorbic acid, there was no change in the urinary volume and urinary output of ascorbic acid. The diuretic effect is therefore ascribed to the ascorbic acid dosage. The delayed response in the rheumatic cases was due to the fact that the children were not in a state of vitamin C saturation as was indicated by their low pre-test ascorbic acid output. The therapeutic implications of these findings are discussed and the author suggests that ascorbic acid may safely be used in those cases in which slow progressive dehydration of the body is desired.

505 Blunt Force Heart Lesions

W MUNCK (*Hospitalstidende* May 11 1937 p 525) draws attention to the possibility of clinically demonstrable heart disease being a late sequel to a blunt force acting on the thorax or some distant part of the body. Hitherto the examinations of the heart after motor-car and other fatal accidents have been mainly macroscopic and the author wondered if systematic microscopical examinations of the heart in such cases might not throw new light on the problem. At the University Medico Legal Institute in Copenhagen he examined microscopically the hearts of thirty two persons twenty-eight of whom had been killed in motor-car accidents in the course of some nine months. In every case death had occurred within sixteen days of the accident, and it had been more or less instantaneous in thirteen cases. This material was classified according to the sex and age of the persons killed and the length

of the interval between the accident and death. In twenty-two cases changes in the heart were evidently due to the accident, although in only ten of these cases was there a fracture of the bones of the thorax. In several cases the changes found were microscopic, and they consisted for the most part of small haemorrhages into the muscles of the heart and under the pericardium or endocardium. The author believes that the mechanism of cardiac haemorrhages from blunt force exerted somewhere on the body is very varied. Direct pressure or traction on the heart may injure its muscles or blood vessels, or the cause may be stasis or nervous impulses acting on the vessels and coming from the central nervous system (vagus action) or from the periphery. Cramp-like contractions of the muscles may also be causal, and when there is a considerable interval between accident and death a toxic process may be at work. The author concludes that even when there has been no direct injury to the thorax blunt force may act indirectly on the heart and be responsible for the subsequent development of clinically demonstrable heart disease.

506 Artificial Pneumothorax

S PUDEK (*Z Tuberk* 1937, 77, 5-6, 321) analyses the answers to a questionnaire which had been sent out to 274 institutions in connexion with their experiences with artificial pneumothorax. From this statistical material the author computes that the number of patients in the whole of Hungary suitable for treatment by this method is about 18 000 while actually it was applied to only 2,183 cases. In the course of the treatment 65 per cent of those who formerly were unable to work were able to resume their occupations. The average duration of treatment was two and a half years, the average number of refills was thirty, the maximum number 160. The therapeutic results differed from one institution to another. The proportion of patients under treatment whose condition proved satisfactory varied from 10 to 70 per cent. The proportion of patients who improved varied from 30 to 70 per cent. From 2 to 20 per cent of patients became worse, from 5 to 30 per cent remained unaffected, and from 1 to 31 per cent died. The author advises that a national organization under State control for the carrying out of artificial pneumothorax treatment should be set up, and makes a number of practical suggestions for the achievement of this plan.

Surgery

507 Mortality of Burns

P LÜTKEN (*Ugeskr Laeg* April 15, 1937, p 409) has undertaken a study of the mortality among the 1,574 patients admitted for burns to the Rudolph Berghs Hospital in Denmark between July 1, 1916 and July 1, 1935. There were 110 deaths in the hospital which is an uncorrected mortality of 7.1 per cent. After eliminating the patients suffering from various diseases before they were burned as well as the patients admitted to hospital some time after the burn, there remained 1,125, of whom ninety-six died, a mortality of 8.5 per cent. A classification according to age showed a mortality of 16.5 per cent in children under the age of 2. Between the ages of 2 and 5 the mortality was 11.4 per cent, between 5 and 15 it was 4 per cent, and between 15 and 65 it was 3 per cent for men and 4 per cent for women. Of the fifteen persons over the age of 65 as many as ten died. By classifying burns into the four categories of scalding burns from clothing flames, and solid or semi-solid bodies the author finds great differences in the mortalities, which were 8.2 per cent and 31.2 per cent.

for the first two categories respectively, and there was not a single death in either of the two remaining categories. In another system of classification the patients were grouped according to the surface extension of their burns, the Berkow scale being adopted for this purpose. The main lesson the author extracts from these calculations is that no true opinion can be formed of the comparative merits of different treatments, unless the patients forming the basis for such a comparison are classified according to the age, the nature of the burn, and the extent of the area involved. The author does not therefore attempt any comparison when he states that of the 1,077 patients treated locally with silver nitrate and an ointment ninety-three died, and of the forty-eight treated with tannic acid three died.

508 Surgical Repair of the Facial Nerve

S. BUNNELL (*Arch Otolaryng* Chicago March, 1937, p. 235) divides the operations into two main groups: (1) the repair of the facial nerve trunk, either in the temporal bone or outside it, and (2) muscle and fascia grafting if the nerve is irreparable or if the facial muscles have undergone degeneration. As a first step the fact that the facial nerve lesion is of the lower neurone type, which involves all the facial muscles from the occipito-frontalis to the platysma must be established. If taste is absent from the anterior two-thirds of that side of the tongue the lesion is localized between the geniculate ganglion and the point at which the chorda tympani arises just above the stylomastoid foramen. In most of the cases suitable for operation the facial nerve paralysis is due to trauma during a mastoid operation or to exposure to cold, as in Bell's palsy. The site is usually in the vertical portion just below the bend where the nerve bows outwards, and may be surrounded by mastoid cells. In Bell's palsy the nerve swells in response to the trauma from cold or from infection. The bony canal is unyielding, the vessels supplying the nerve become compressed, and necrosis over a length of the nerve may result, as in Volkmann's ischaemia. Decompression should be a certain cure, but considering that 80 per cent of the patients recover spontaneously this routine procedure would result in many unnecessary operations. In the author's opinion repair by anastomosis with other nerves is now obsolete, as it does not restore emotional facial expression thereby causing dissociated movements. In intratemporal repair the facial nerve is exposed in the Fallopian canal. If the nerve ends on either side of the lesion are not too far apart direct apposition must be attempted, as this gives better results than the interposition of a nerve graft. By chiselling away part of the tympanic plate and by freeing the nerve from the parotid gland, from 1 to 2 cm. can usually be gained in length. When the facial muscles no longer respond to galvanic stimulation and have undergone fibrous degeneration portions of the temporal and masseter muscles are used (Gillies's technique). The fascial strips from the temporal muscle are distributed about the eye, and those from the masseter muscle are attached about the mouth.

509 Thoracoplasty

G. URQUHART (*Amer. rev. Tuberc.* April, 1937, p. 443) reviews 200 consecutive thoracoplasties performed in the Connecticut State Sanatoria where each patient's case is discussed at a combined surgical and medical conference, after which he is transferred to a surgical ward for observation and a complete overhauled of all vital organs is made. In this series the best results were obtained in patients between the ages of 20 and 40 and operations on the left side were more satisfactory than those on the right. The amount of sputum, the presence of fluid, haemoptysis or an existing pregnancy did not appear to influence the prognosis. Dyspnoea on slight exertion, or following collapse therapy, or after coughing was a contra-indication. 115 of the patients were classified as favour-

able cases before operation, and in 92 per cent. the results were good. Fifty-four were considered doubtfully favourable, and in 81 per cent. the results were good. Thirty-one were definitely unfavourable, and in 55 per cent. the results were good. Avertin, in doses which never exceeded 80 mg. for each kilogramme of weight, was used with complete satisfaction as a basal anaesthetic. It was sometimes supplemented with 1/2 per cent. novocain or a small amount of nitrous oxide. In order to obtain a satisfactory position for operation the patient was strapped to a specially constructed cork mould covered with canvas. The author advises that rib resection should never be performed in less than three stages. After operation the patients were fitted with sponge-rubber jackets, two inches thick, held in place with a well-fitting binder and shoulder straps. Sand bags up to 15 lb. in weight were used for the first three months, after which the patients were allowed to get up although the jacket was worn for another three months in order to prevent re-expansion of the lung. Following the operation eighty-seven patients were able to do their ordinary work, eighteen were only able to do light work, and fourteen little or none. Four patients became worse and twenty-five died within a period of from forty-eight hours to three years afterwards.

510 Solitary Cysts of the Kidney

A. RAVICH and S. M. TURKELTAUB (*Urol. cutan. Rev.* April, 1937, p. 260) report seven cases in patients aged from 41 to 69, of whom four were men and three women. In five instances there were definite associated pathological lesions which may have contributed to the formation of the renal cysts. In three cases nephrolithiasis with moderate infection was present, and in one case an infiltrating papillary carcinoma of the ureter with secondary hydronephrosis was found. The fifth patient had chronic nephritis with hypertension, arteriosclerosis, and diabetes, and another case had a renal calculus on the opposite side. The present series therefore supports Hepler's view that any lesion, local or constitutional capable of causing tubular occlusion and interference with blood supply may be responsible for the formation of these cysts. The lesion in the present cases varied in size from that of a small tangerine orange to that of a large sac containing over 1,500 c.c. of fluid. In all the cases the lower pole of the kidney was involved. In six cases the anterior and in two the posterior surface were the sites of origin. All the cases were histologically benign. Five of the cysts contained straw-coloured fluid and two haemorrhagic fluid. No special symptoms were encountered, and most of the patients sought advice for an associated lesion. Diagnosis was made by x-ray examination, which showed a globular mass causing a disfigured and irregular appearance of the kidney. Treatment consisted in complete enucleation of the cyst. Nephrectomy was never necessary.

Therapeutics

511

The Anaemias

H. SCHULTEN (*Fortschr. Therap.* April, 1937, p. 200) points out that in the anaemias therapy depends largely upon correct diagnosis. He classifies them as follows: (1) secondary anaemia, including hypochromic anaemia, anaemia following infection, chronic bleeding or pregnancy; (2) pernicious anaemia; (3) familial haemolytic icterus; (4) aplastic anaemia; (5) anaemia due to hepatic disease, gastric cancer and leukaemia. Iron is of the greatest value in hypochromic anaemia, but the ferrous salts, ferrum redactum, and combinations of ammonium and ferric citrate alone are worth consideration. They have to be given in large doses and the oral route is the only practical one as intramuscular and intravenous injections of iron are too painful. Rectal administration is theoretically possible but has not been made use of to any extent. Good results have been reported from the

administration of from 30 to 60 drops daily of a 1 per cent copper sulphate solution in aplastic anaemia and in hypochromic anaemia in children. Arsenic has fallen into disrepute, but should be used in cases which are resistant to other forms of therapy. The value of liver in the treatment of pernicious anaemia is indisputable. The criterion of effectiveness in this treatment is the patient's condition, as it is impossible to evaluate the activity of liver preparations by weighing or by titration. A substance which would prevent pernicious anaemia has not yet been chemically identified. The best liver extracts are those which are purest and most concentrated. At the beginning of treatment high dosage is essential, but when normal blood counts are obtained it may be lowered. Intramuscular injection is the method of choice, but oral administration of undercooked fresh liver or of liver extract is also of value. In refractory cases of pernicious anaemia the diagnosis may be at fault, or the dosage may be too small, or the preparation in use may be inactive. Splenectomy is curative in the treatment of familial haemolytic jaundice, and it is sometimes of value in aplastic anaemia. Transfusion of blood or of normal saline is not as much used as it was before the introduction of liver therapy, but is still of value in cases of acute haemorrhages.

512 Local Treatment of Diphtheria

C RAUSCH (*Thèse Paris* 1937, No 263), who reports thirteen cases of diphtheria in persons aged from 2 months to 43 years, states that the neutral sulphate of oxyquinoline presents the qualities of an ideal antiseptic, as it is not caustic, does not produce coagulation, is practically harmless, and has been shown to have an excellent antiseptic action on the diphtheria bacillus. *In vitro* in a dilution of 1 in 25,000 after prolonged action of one hour it can sterilize a broth culture of diphtheria bacilli of forty-eight hours' growth. Clinically the neutral sulphate of oxyquinoline produces sterilization of the nasopharynx in 81 per cent of carriers in six days, while the ordinary methods are successful in only 46 to 60 per cent. The length of time taken to sterilize the nasopharynx can be still further reduced by beginning treatment on the first day of the disease, repeating it four times daily, and continuing it for about ten days.

513 Graves's Disease

O RAAGAARD (*Ugeskr Laeg* April 29, 1937, p 453) draws attention to the lack of unanimity as to the respective merits of radiological and other treatment for Graves's disease. Of late in Denmark the value of radiological treatment has been much underestimated, as the impression that it is more or less an unessential supplement to medicinal treatment is widespread. The author has conducted a follow-up study of sixty-eight definite cases which were given radiological treatment, ambulatory in most cases, between 1922 and 1933 in a Danish hospital. The disease was severe in six cases, moderately severe in twenty-six and mild or slight in thirty-six. An observation period of three to eleven and a half years was counted from the conclusion of treatment. In fifty-seven cases the follow-up study included a medical examination. Recovery could be claimed in 70.6 per cent, and almost complete recovery in 7.4 per cent. The improved represented 10.3 per cent, while 7.4 per cent were unchanged. There was one death from Graves's disease in addition to two deaths from other causes. In 85.3 per cent complete fitness for work was found on re-examination and 5.9 per cent were partially fit. No patient was refused radiological treatment or found to be refractory to it. In 64 per cent the goitre disappeared completely. The average duration of treatment was 11.9 months and the average number of exposures was 7.3. The author's comparison of his experiences with those of radiologists in other countries reveals a certain uniformity in the results achieved. He concludes that radiological treatment produces as good results as does operative therapy.

Radiology

514 Cardiovascular Syphilis

J E KEMP and K D COCHEMS (*Amer Heart J* March, 1937, p 297), in an attempt to evaluate teleradiographic measurements in uncomplicated early syphilitic aortitis, have compared the teleradiographs of the heart and aorta in 1,000 cases of unselected syphilitics with those of 600 unselected non-syphilitic individuals of the same occupational, sex, and age groups. The Vaguez-Bordet measurements of the supracardiac shadow were used in comparing the width of the aortic arch. Only 5.9 per cent of patients with clinically recognizable syphilitic aortitis showed teleradiographic evidence of aortic dilatation, but there was no evidence that the diagnosis of uncomplicated syphilitic aortitis can be made by teleradiography alone.

515 Diaphragmatic Hernia

M F DWYER (*Radiology* March 1937, p 315) finds that the incidence of herniation of a portion of the cardiac and of the stomach through the oesophageal hiatus is on the increase. Herniation of a part or all of the cardiac end of the stomach is a definite clinical entity. However, unless the hernia is comparatively large it may exist for years without causing symptoms and when demonstrated other upper abdominal and mediastinal conditions capable of producing similar symptoms must be excluded before the hernia can be considered as the cause of the patient's complaints. Unless the radiologist has some reason to suspect the presence of a diaphragmatic hernia and examines the patient in a supine position the diagnosis will be missed in the majority of cases.

516 X-ray Therapy in Obliterating Endarteritis

DESPLATS and LANGERON (*J Radiol Électrol* April, 1937, p 152) have treated the adrenals with x rays in 200 cases of obliterating endarteritis and claim good results in 62.5 per cent and improvement in 22.5 per cent. Only 5 per cent failed to respond to the treatment. Diabetic endarteritis seemed to respond to the treatment in almost every case. They used 130 kilovolts filtered through 5 to 7 mm of aluminium, 150 to 250 units to each adrenal region alternatively every second day until improvement set in. They find that it may be necessary to continue the treatment for one, two, or even three months with short breaks between each series of six treatments. In a few cases of intermittent claudication treated in this way the cure has been maintained for seven to eight years.

517 Arteriography

R DEMEL and M SGALITZER (*Wien klin Wschr* May 7, 1937, p 595) stress the therapeutic value of arteriography in cases of endarteritis obliterans, Raynaud's disease, arteriosclerosis thrombosis, etc. apart from the important diagnostic value of the method. In a number of cases they were able to observe a remarkable improvement in the condition of the limb following an intra-arterial injection of 20 ccm of a 20 per cent solution of perabrodil. They explain the favourable therapeutic result by a persistent dilatation of the arterioles following the injection. The injection can be repeated after some time if necessary.

518 Cholecystography

F J HODGES and T LAMPE (*Amer J Roentgen* February 1937, p 145) review the results of over 2,700 cholecystographic examinations by the oral method. They conclude that the radiographic recognition of gall stones is reliable in 97 per cent of those cases in which the

gall bladder has preserved sufficient concentrating power to permit visualization in any degree. Cholelithiasis is always attended by some deviation from the normal cholecystographic findings, and impaired concentrating power of the gall bladder was found in 87.6 per cent of patients suffering from gall stones. Normal response to the cholecystographic test was found to exclude a major inflammatory disease of the gall bladder in 84 per cent of cases, while complete non visualization was associated with major inflammatory involvement in 80 per cent of cases.

Obstetrics and Gynaecology

519 Follicular Hormones and the Pregnant Uterus

H. DRUCKREY and H. BACHMANN (*Zbl Gynäk.*, May 8 1937 p 1091) have investigated the action of follicular hormones on the pregnant uterus in cats and rabbits. The observations were made on uteri exposed by a laparotomy. An application of 1/2 to 2 Voegtlin oxytocic units caused a short contraction of the uterus, but a subsequent intravenous injection of follicular hormone gave rise to powerful and persistent uterine contractions. In several animals this was followed by premature labour and delivery. The authors discuss the possible theories of the action of the hormone, and propose to try the follicular hormone on pregnant women at term.

520 Folliculin Inunction in Pruritus Vulvae

E. KLAFTEN (*Zbl Gynäk.*, April 24, 1937, p 972) describes the successful treatment of pruritus vulvae by rubbing into the shaved vulvar and perivulvar skin large doses of follicular hormone. So-called essential cases, in which there are local causes or constitutional causes such as metabolic or renal disease were not treated. Six of ten trial cases responded satisfactorily to inunction alone, but in the others it had to be combined with injection therapy. Of thirty eight cases the results of this combined folliculin treatment were satisfactory in over two thirds. When patients were beyond the menopause or if their menstrual history showed signs of ovarian hypofunction, results were even better. The treatment often made pruritus worse in those with normal or three week cycles. Deep x ray or radium treatment in comparison gave nearly three fourths of failures. Concomitant results of the treatment were swelling of the breasts, increased vaginal discharge, and very frequently in women beyond the menopause transitory vaginal bleedings. Too large dosage sometimes caused headache, nausea and palpitation, and nurses who did the anointing with ungloved hands had similar symptoms. Occasionally hypersensitive subjects reacted to combined inunction injection treatment by acute oedema followed by irritation and dermatitis in face, hands, vulva and thighs. In general Klasten now restricts the treatment to cases in which ovarian insufficiency is probably present and divides it into three phases. In the first 4 000 to 8 000 units daily are rubbed in locally for six days. During the next five weeks parenteral injections are given diminishing from 30 000 units every other day to 10 000 units twice weekly combined with inunctions of 4 000 units at first daily and towards the end once or twice weekly. The third phase consists in a series of two to six weeks weekly inunctions. The ointment now used contains 50 000 units which correspond to 5 mg of crystallized follicular hormone in 50 grammes. It is combined with a local anaesthetic for the first applications are apt to be followed by local hyperaemia and increased irritation. Similar treatment was found very successful in cases of Quincke's oedema, acne, or symmetrical dermatitis associated with signs of ovarian hypofunction; it also succeeded in kraurosis vulvae when combined with inunction of vitamin A.

1352 p

Pathology

521 Lymphogranuloma Inguinale

K. YAMAMOTO (*Jap J Derm Urol*, March 20, 1937, p 91) reports the results of his investigations on Frei's reaction in lymphogranuloma inguinale. It was negative in 99 per cent of patients who were not suffering from the disease. On the other hand, it was positive in 50 per cent of patients suffering from lymphogranuloma inguinale within the first few weeks of the disease, and it became positive in a large majority of cases as soon as the skin adhered to the affected glands. The reaction remained positive in some instances for as long as ten and twenty years after the cure of the disease. The author considers the Frei reaction a reliable specific test for lymphogranuloma inguinale.

522 Haemolytic Streptococci in Normal Throats

T. KODAMA (*Kitasato Arch exper Med*, January, 1937, p 29) has classified the haemolytic streptococci obtained by culture from throat and tonsillar swabs taken weekly in the winter from fifty normal people, aged from 5 to 30. In forty four of these haemolytic streptococci were demonstrated at some time or another during the five weeks they were under observation. In all ninety-two strains were isolated, thirty eight falling serologically into group A, twenty into G, eighteen into C, eleven into F, two into B, and three strains were not identified with group sera. Thus thirty-eight individuals had in their throats group A strains mixed with strains of group C, G or F. In thirty cases of simple or follicular tonsillitis twenty-seven had group A strains only in their throat; in the other three cases this was accompanied by group C or G strains. All the strains of groups A, C, and G were definitely fibrinolytic for human fibrin and fifty three of the sixty eight group A strains were specifically toxigenic for human beings while those of B, C, F and G were not. All the group A strains produced redox reversible soluble haemolysin. The author concludes that this group of haemolytic streptococci, 76 per cent of all the strains isolated, is more common in the normal human throat than is usually supposed.

523 Prontosil in Streptococcal Infection

BÜRGERS (*Deutsche med Wochschr*, April 23, 1937, p 672) reports observations on prontosil from the Hygiene Institute in Königsberg. In certain respects he confirms the findings of Leonard Colebrook and his associates in connexion with this drug. Professor Bürgers has tested it on 112 rabbits, 85 guinea-pigs and some 500 mice. In the test tube the drug appears to have no bactericidal action on streptococci or pneumococci, nor does it promote phagocytosis either in the test tube or under any other conditions. There is also no question of *sterilisatio magna*. Having made these and other reservations Professor Bürgers proceeds to claim that at the present time prontosil is the most effective remedy available for streptococcal infections of every description. The drug must be given as early as possible and in large doses. The first intramuscular injection is best followed by oral administration and should the acidity of the gastric juice be low dilute hydrochloric acid should be prescribed. Nervous patients who are likely to be frightened by the discoloration of the urine should be given prontosil album. Coliform infections of the urinary tract react satisfactorily to this drug particularly in children and infants. It is not yet clear whether the action of prontosil can be increased by specific serotherapy and there is still some uncertainty as to the reasons for occasional disappointments in connexion with the reaction of certain strains of streptococci. Professor Bürgers would be grateful for the receipt of such apparently prontosil resistant strains in order to pursue further research. He adds that prontosil seems to be effective as a prophylactic as well as a curative remedy.

FITNESS

AND THE FAT-SOLUBLE VITAMINS

Whether for expectant and nursing mothers, growing children or rapidly developing adolescents, Adexolin provides essential protective elements at all seasons

Special demands for Adexolin at the present time may be due to a deficiency of fat-soluble vitamins in the diet, as the consumption of fats is greatly reduced in hot weather. Moreover, a seasonal tendency to metabolic and gastro-intestinal disturbances may result in a limitation of vitamin intake and assimilation.

For these reasons doctors use Adexolin to ensure a sufficiency of vitamins A and D. Vitamin A enhances resistance to infection of the respiratory, intestinal and genito-urinary systems; vitamin D governs calcium metabolism and safeguards the integrity of skeletal and dental structures. Together in Adexolin, these vitamins promote the orderly development and maintenance of the tissues. The sense of well-being conferred by Adexolin regularly demonstrates the high "tonic" qualities of this rational combination and concentration of vitamins A and D.

ST. ANDREW'S HOSPITAL FOR MENTAL DISORDERS NORTHAMPTON.

FOR THE UPPER AND MIDDLE CLASSES ONLY

Presided by THE MOST HON. THE MARQUESS OF EXETER C.M.G. A.D.C.

Medical Superintendent DANIEL F. RAMBAUT M.A. M.D.

This registered Hospital is situated in 120 acres of park and pleasure grounds. Voluntary patients who are suffering from incipient mental disorders or who wish to prevent recurrent attacks of mental trouble (temporary patients) and certified patients of both sexes are received for treatment. Careful clinical, biochemical, bacteriological and pathological examination. Private rooms with special nurses male or female in the Hospital or in one of the numerous villas in the grounds of the various branches can be provided.

WANTAGE HOUSE

This is a Reception Hospital in detached grounds with a separate entrance to which patients can be admitted. It is equipped with all the apparatus for the most modern treatment of Mental and Nervous Disorders. It contains special departments for hydrotherapy by various methods including Turkish and Russian baths, the prolonged immersion bath, Vichy Douche, Scotch Douche, Electrical bath, Plombieres treatment, etc. There is an Operating Theatre, a Dental Surgery, an X-ray room, an Ultra Violet Apparatus, and a Department for Diathermy and High Frequency treatment. It also contains Laboratories for biochemical, bacteriological and pathological research.

MOULTON PARK.

Two miles from the Main Hospital there are several branch establishments and villas situated in a park and farm of 650 acres. Milk, meat, fruit and vegetables are supplied to the Hospital from the farm, gardens and orchards of Moulton Park. Occupation Therapy is a feature of this branch and patients are given every facility for occupying themselves in farming, gardening and fruit growing.

BRYN-Y-NEUADD HALL

The seaside house of St. Andrew's Hospital is beautifully situated in a Park of 330 acres. Llanfairfechan amidst the finest scenery in North Wales. On the North West side of the Estate a mile of sea coast forms the boundary. Patients may visit this Branch for a short seaside change or for longer periods. The Hospital has its own private bathing house on the seashore. There is trout-fishing in the park.

At all the branches of the Hospital there are cricket grounds, football and hockey grounds, lawn tennis courts (grass and hard courts), croquet grounds, golf courses and bowling greens. Ladies and Gentlemen have their own gardens and facilities are provided for handicrafts such as carpentry, etc. For terms and further particulars apply to the Medical Superintendent (Telephone No. 2356 and 2357 Northampton) who can be seen in London by appointment.

THE COPPICE, NOTTINGHAM.

HOSPITAL FOR MENTAL DISEASES

This Institution is exclusively for the reception of a limited number of Private Patients of both sexes of the Upper and Middle Classes at moderate rates of payment. It is beautifully situated in its own grounds on an eminence a short distance from Nottingham and from its singularly healthy position and comfortable arrangements affords every facility for the relief and cure of those mentally afflicted. Occupational Therapy. Voluntary and Temporary Patients received.

Tel. 64117. For terms etc. apply to the Medical Superintendent.

W G SAVAGE
County Medical Officer of Health
County Health Department,
County Hall Taunton

INDIAN MEDICAL SERVICE

RECRUITMENT OF EUROPEAN OFFICERS

Applications are invited from Medical Men for Permanent Commissions in His Majesty's Indian Medical Service. The terms offered include a gratuity of £1 000 on retirement after six years' service, or of £2 500 after 12 years' service, together with free return passages, for those who no longer desire to remain in the Service. In other respects the terms will be as detailed below.

British subjects of pure European descent who are under 32 years of age and who are registered under the Medical Acts in force in Great Britain and Northern Ireland are eligible to apply.

CAREERS

The Indian Medical Service offers a permanent career with wide opportunities of medical experience including clinical preventive specialist and research work. At the beginning of his career an officer is employed on the military side which has medical charge of the Indian Army. Promotion is on a time scale up to the rank of Lieutenant Colonel and by selection to the ranks of Colonel and Major General. An officer may apply after one year's Indian Service to have his name registered for transfer to the civil side, from which appointments are made to Civil Surgeoncies which are established at the principal civil centres to provide for the medical needs of Civil Officers and for general medical administrative purposes to specialist (for example public health and bacteriological) services to research posts and to professorships at the Medical Schools.

25	"	1500	40	1830

Note—(1) The rupee is at present stabilised at a rate equivalent to 1s. 6d.
(2) An officer promoted to the rank of Lieut.-Colonel before completing 20 years' service will receive pay at the rate of Rs. 1200 per mensem (basic) plus 140 per month overseas pay.

Extras—In addition to the above number of pay may be held by officers who are also attached to the numerous administrative appointments open to officers in both branches of the Service.

ANTEDATES IN COMMISSION

Candidates possessing certain higher medical qualifications or holding the Diploma in Public Health may be granted an antedate in their commissions. Past service in certain hospital appointments may also render candidates eligible for an antedate. Persons holding or about to hold resident posts at recognised hospitals

may be seconded in those posts for a period. The maximum period of antedate, secondment or antedate and secondment combined admissible under this paragraph is limited to 18 months.

OUTFIT ALLOWANCE

Officers on appointment will receive an allowance of £75 towards the cost of outfit.

PRIVATE PRACTICE

With the exception of Administrative Officers military or civil and officers holding certain special appointments officers are not debarred from taking private practice so long as it does not interfere with their proper duties.

LEAVE

Leave can be taken at reasonable intervals, and adequate rates of leave pay are provided. Extra leave (known as study leave) which may not exceed 12 months in all during an officers' service may be granted to officers desirous of pursuing special courses of study of a post graduate nature. During such leave, study allowance, at present fixed at the rate of 12s. a day in the United Kingdom, £1 a day on the Continent of Europe, and £1 10s. a day in the United States of America and Canada is granted to an officer in addition to ordinary rates of leave pay.

PENSIONS

The rates of pensions are as follows —	Per annum
After 17 years' service for pension	£372 0s.
" 18 " " "	£400 0s.
" 19 " " "	£428 0s.
" 20 " " "	£465 0s.
" 21 " " "	£502 0s.
" 22 " " "	£539 10s.
" 23 " " "	£576 10s.
" 24 " " "	£614 0s.
" 25 " " "	£651 0s.
" 26 " " "	£697 10s.
" 27 " " "	£744 0s.

There are additional pensions ranging from £65 to £350 per annum for officers who have held administrative appointments.

PASSAGES

An officer on appointment is provided with free passage to India. The families of officers who are married prior to the date of the officers' embarkation on first appointment will also be provided with free passage to India subject to the payment of messing charges. Officers and their families are also eligible for passage concessions under which they are granted a certain number of return passages home at Government expense during their service.

INSTRUCTION PRIOR TO EMBARKATION

Officers are required to undergo courses of instruction at the Royal Army Medical College and at Aldershot lasting approximately three months prior to their embarkation for India on first appointment. Information as to the rates of pay admissible during this period and subsequently up to arrival in India is contained in the memorandum referred to below.

A memorandum giving full details regarding these appointments and forms of application may be obtained from the UNDER SECRETARY OF STATE FOR INDIA, MILITARY DEPARTMENT, INDIA OFFICE, LONDON, S.W.1. The Selection Committee will meet at the India Office in July next and the selected candidates will be required to join a course of instruction commencing on September 1st prior to sailing for India about December 1937. Applications should be submitted as soon as possible.

COUNTY COUNCIL OF MIDDLESEX

SURGEON—GRADE I

WEST MIDDLESEX COUNTY HOSPITAL

ISLEWORTH

Applications are invited from registered Medical Practitioners for the above appointment on the pensionable staff. The appointment is a senior one in the Council's general hospital service and applicants are expected to be medical men or women of high qualification and professional attainments who are devoting their time wholly or chiefly to the practice of general surgery. The officer appointed will work under the direction of the Medical Superintendent of the Hospital and will give his whole time to the duties of the post. He must be prepared to undertake the teaching of students if required and to carry out such other duties as the County Council may from time to time direct.

The Hospital has some 1,350 beds about 600 of which are devoted to the treatment of acute conditions. There is a separate maternity wing, a pathological laboratory and animal house and departments of orthopaedics, radiology, electrotherapy and ophthalmology.

Salary £1,000 per annum rising by annual increments of £50 to £1,500 per annum. The salary is inclusive and any fees received by the officer appointed must be paid over to the County Council. The appointment is non-resident but the successful candidate will be required to reside within a short distance of the Hospital. The appointment which will be subject to medical examination, will be held during the pleasure of the Council and is terminable by three months' notice on either side.

Applications stating age, qualifications and experience together with copies of not more than three recent testimonials must be received by the undersigned not later than July 10th. Relationship to any member or officer of the Council must be disclosed in the application. Application forms are not provided. Envelopes must be endorsed "Surgeon West Middlesex County Hospital." Canvassing directly or indirectly will be a disqualification.

A TYPICAL OPINION

Extract from a letter received in May 1937 —

' At the Annual Meeting of the County Tuberculosis Care Committee held last week a Medical Member of the Committee referred to your preparation Numol and spoke of the beneficial results he had experienced in patients taking it.

Doctors who have not already prescribed Numol are asked to send a post card for a free sample
